1.0 INTRODUCTION

1.1 GENERAL

Willis Construction are proposing to redevelop a site at Open Hearth, Ringland for residential end-use. A site location and site plan are presented in Figures 1 and 2.

Intégral Géotechnique (Wales) Limited have been appointed as the Geotechnical Engineers to undertake a site investigation to enable a geotechnical and geoenvironmental appraisal of the site and provide a basis for design.

This report presents the findings of the site investigation and gives recommendations for the design of foundations, floor slabs and other geotechnical and geoenvironmental aspects of the project.

This report (including all appendices to it and any subsequent addendums or correspondence) has been prepared for the sole benefit, use and information of Willis Construction and no third party is entitled or permitted to rely on it. This report may not be used, reproduced or circulated (in whole or part) for any purpose without the written consent of Intégral Géotechnique (Wales) Limited. Intégral Géotechnique (Wales) Limited shall not be liable to any third party who does not have such express written permission to rely on the report for any losses they may suffer.

1.2 PROPOSED DEVELOPMENT

A sketch layout for the scheme indicates that the proposed development will likely comprise of 32 units comprising a combination of low rise properties and 2 to 3 storey apartment buildings. The development will also include associated access roads, car parking areas, private gardens and areas of soft landscaping. The sketch layout is shown on Le Truco Design Drawing No. LTS296.03.01, Revision B, dated July 2021. An extract of this layout plan is presented in Figure 3.

1.3 SCOPE OF WORKS

The work instructed included a desk study of available information, site reconnaissance and intrusive investigation. This was followed by laboratory testing and geotechnical and geoenvironmental reporting.

The desk study comprised a review of:

- An Envirocheck Report obtained for the site,

1.3 SCOPE OF WORKS (CONTINUED)

- Old Ordnance Survey maps covering the site, included within the Envirocheck Report,
- A Radon Report obtained from the British Geological Survey,
- Geological maps of the area provided by the British Geological Survey,
- The Environment Agency groundwater vulnerability map and aquifer database for the area,
- Existing site investigation data, if available.

The desk study information was used to make an initial assessment of the site and to design an investigation to be carried out by Intégral Géotechnique. The site investigation was designed in accordance with BS 5930:2015+A1:2020, the Code of Practice for Site Investigations, BS10175:2011+A2:2017, the Code of Practice for Investigation of Potentially Contaminated Sites, and 'Development of Land Affected by Contamination: A Guide for Developers' prepared by Welsh Local Government Association (WLGA)/Natural Resources Wales (NRW) Land Contamination Working Group, 2017.

The site investigation included:

- An intrusive investigation carried out on the 4th January 2023 comprising of five windowless sample boreholes and one hand excavated trial pit,
- Sampling of made ground for laboratory chemical testing,
- Sampling of in-situ soils for geotechnical testing,
- Falling head permeability/soakaway testing was undertaken in selected boreholes.

1.4 LIMITATIONS

This document is intended to be a working document for further development in discussion with all concerned including the Local Planning Authority, Natural Resources Wales, and the NHBC as appropriate.

"Contamination" is taken throughout the report to mean the "presence of one or more potentially harmful substances as a result of human activity". The use of the term in this way does not imply that harm is being or might be caused by the contamination. It should be noted that "contamination" can have different meanings under different regulatory regimes, for example, planning, building control and Part IIA of the Environmental Protection Act 1990. Naturally elevated concentrations of potentially harmful substances may also be of concern and the significance of any that have been found is also evaluated in this report.

1.4 LIMITATIONS (CONTINUED)

It is important to recognise that there may be areas of contamination that have not been found, or that contaminants are present at concentrations above those that have been found.

It is also important to recognise that contamination may be localised and that no investigation, however comprehensive, is capable of finding such occurrences other than by chance.

It should also be noted that vertical and lateral changes in ground conditions may be present between exploratory hole locations.

Access for the intrusive site investigation was limited at the time due to stockpiles of materials located across the site, the presence of demolition rubble within the footprint of the former pub building, uneven sloping ground within the northern area of the site and the presence of buried services. A foul sewer main runs through the southern area of the site. Two water mains run north to south within the eastern area of the site. A water course/ drain runs through the southern area of the site.

It should also be noted that due to the presence of buried serves, the area of the former filling station was inaccessible at the time of the site investigation.

2.0 THE SITE

2.1 SITE LOCATION AND DESCRIPTION

The site is located in Ringland, Newport, at a National Grid Reference of 335480, 188120, see Figure 1.

The site is irregular in shape and occupies an area of approximately 0.82 hectares. The boundaries of the site are defined by Hendre Farm Drive to the north and northeast, residential properties to the east, the A48 Southern Distributor Road to the south and mature trees to the west with residential properties beyond. A site plan is presented in Figure 2.

The site is situated on sloping ground that slopes down from an approximate elevation of 18m AOD in the north, dropping some 5m in elevation to approximately 13m AOD in the south.

The Open Hearth Inn which was formerly situated in the southwest and west of the site had been demolished, with the demolition rubble located within the footprint of the former building. Areas of asphalt hardstanding surrounded the former building.

The south-eastern area of the site had been fenced off. The fenced off area comprised of a tarmacked area with large amounts of fly-tipped material.

The northern area of the site was steeply sloping and had a covering of grass.

Several buried services were identified on site. BT and high voltage (HV) cables are present along the northern site boundary. A low voltage (LV) cable was identified entering site from the north-western corner and extending into the footprint of the former building. A foul sewer main runs through the southern area of the site. Two water mains run north to south within the eastern area of the site.

An unnamed surface water feature/drain flows in an approximate east to west orientation through the southern area of the site. The watercourse is partially culverted within the central/eastern area and an open water course in the western area and in the eastern most part of the site. At the time of the site investigation, the watercourse was noted to be dry.

Demolition rubble was present across the site, mainly concentrated in the area of the former Open Hearth Pub.

2.2 SITE OPERATIONS

There are no current site operations, with the site remaining vacant following demolition of the former Open Hearth Pub.

2.3 SURROUNDING LAND USE

The surrounding areas are mainly developed for residential use. The A48 is present to the south of the site's boundary.

2.4 AVAILABLE SITE INVESTIGATION DATA

There is no available site investigation data for the site to our knowledge.

2.5 CONSULTATIONS WITH REGULATORS

Newport City Council were consulted with regards to any contaminated land records for the site. Additionally, Newport City Council consulted their petroleum licensing department with regards to the former fuel filling station use and the potential for any former fuel storage tanks within the site.

Newport City Council have confirmed that the site is not the subject of any contaminated land investigations and has not been determined as contaminated land.

The petroleum licensing department do not have any records for the site.

A copy of the regulator's correspondence is presented in Appendix A.

3.0 SITE HISTORY

The recent history of the site has been traced with the aid of an Envirocheck Report, a copy of which is included in Appendix B. The Envirocheck Report includes the following scaled historical maps:

Map Scale	Dates
1:2,500	1883, 1901, 1920, 1937, 1965-1968, 1971, 2000 (Aerial Photo)
1:1,250	1964, 1973-1976, 1974, 1975, 1987, 1992, 1994
1:10,560	1886-1887, 1902, 1922, 1938, 1947, 1954
1:10,000	1965, 1973, 1983, 1987, 1981-1989, 1999, 2006, 2022

The earliest edition of the map dated 1883 indicated the site to be largely undeveloped green fields, likely for agricultural use with trees sporadically located across the fields. Hendre farm buildings were located in the eastern area of the site and continued to extend off the site to the east. A possible pond was located just off the eastern site boundary. A well was also located within the eastern area of the site. A pathway was indicated to run through the centre of the site from east to west. A river was located along the southern site boundary. The area surrounding the site consisted of undeveloped green fields. Ringland Wood was located approximately 75m north of the site boundary.

The map dated 1901 indicated two further footpaths or tracks were located onsite, entering the site from the north and northwest and connecting to the pre-existing footpath in the centre of the site. A further small building had been constructed in the eastern area of the site and a further building had been constructed just off site to the east., The area surrounding the site remained relatively unchanged.

The 1920 edition of the map indicated a further building had been constructed within the eastern area of the site. The footpath/track that entered the site from the northwest was no longer shown. The well located within the eastern area of the site was also indicated to be no longer present. Ringland Woodland, now known as Ringland Brake was indicated to have been deforested and consisted of rough pasture. A building, labelled as The Hendre, had been constructed approximately 275m northwest of the site boundary.

The site and surrounding area remained relatively unchanged until the 1937 edition of the map. A map dated 1937 indicated a tank, along with another building had been constructed within the centre of the site. The area surrounding the site remained relatively unchanged. A pond was located in the southwest of the site, to the south of the watercourse.

3.0 SITE HISTORY (CONTINUED)

By the 1964 edition of the map, Hendre farm had been demolished, with no buildings or tank remaining on the site. The river which extended across the southern area of the site had been straightened. The pond located in the southwest of the site had been infilled.

Significant development had occurred in the wider area. Large residential developments had been constructed to the north, east and west of the site. The land immediately to the west and south of the site remained undeveloped. Hendre Farm Drive had been constructed along the site's northern boundary. A bus shelter was located to the north of the site. The B4004 road was located to the south of the site, with Hartridge High School beyond approximately 65m south of the site boundary, which comprised of numerous buildings and playing fields. An area of open green space was located approximately 80m north of the site boundary.

By 1971 the Open Hearth pub had been constructed in the western area of the site, with associated parking areas and pathways covering the majority of the remaining area of the site. A small building had also been constructed on the eastern site boundary. The watercourse located near the southern site boundary was indicated to have been partially culverted. The B4004 road was now noted as the A455. Two access roads entered the site from the A455, crossing the culverted watercourse. Further residential development had occurred immediately to the west of the site. A filling station had been construction approximately 62m southwest of the site's boundary.

The 1973 edition of the map indicated a small building had been constructed in the central part of the site. 1974 edition of the map indicated a filling station had been constructed in the south-eastern area of the site.

The site and surrounding area remained relatively unchanged over the subsequent years with the Open Hearth pub remaining in the same configuration on site.

The 1992 edition of the site map indicated that three buildings were located in the central to eastern areas of the site. An 'L' shaped building was located on the location of the filling station noted on the 1974 and 1975 maps. Small electrical substations were located approximately 35m northeast and 68m west of the site boundary.

The aerial photo published in 2000 indicated the building in the central to eastern area of the site, including the filling station were no longer shown, however, areas of hardstanding and suspected floor slabs remained. No other changes were recorded on site and the surrounding area remained unchanged.

3.0 SITE HISTORY (CONTINUED)

By 2006, the south eastern area of the site had been fenced off.

By this time the A455 had now been extended to the sites southern boundary and was noted as the A48. The two junctions that previously entered the southern area of the site off the A455 had been removed and there was no access into the site from the A48. The 2006 Aerial image of the site also indicated materials had been stockpiled on site. No further changes occurred to the site or surrounding area.

The 2016 aerial image of the site indicated trees/vegetation were located along the boundary of the fenced off area in the south eastern area of the site. The trees/'vegetation had been removed by 2018.

By 2021, the Open Hearth Pub had been demolished and no further changes occurred onsite or within the surrounding area to the present day.

4.0 SITE ENVIRONMENTAL SETTING

4.1 PHYSICAL SETTING

The site is located within a mainly residential setting within the well-established district of Ringland to the northeast of Newport.

The site is situated on ground which generally slopes down to the south from an approximate maximum elevation of 18m AOD in the north to an approximate minimum elevation of 13m AOD in the south.

An unnamed surface water feature/drain flows in an east to west orientation through the southern area of the site. The watercourse is partially culverted within the central area of the site and an open watercourse in the western part and eastern most areas. At the time of the site investigation, the watercourse was noted to be dry.

4.2 GEOLOGY

The 1:50,000 scale geological map of the area indicates the site to be underlain by strata of the St Maughans Formation of the Early Devonian Period. These rocks typically comprise of interbedded purple, brown and green sandstones and red mudstones.

Along the northern and south western boundary of the site the 1:50,000 scale geological map indicates the site to be underlain by the Blue Anchor Formation of the Triassic period. These rocks typically comprise of pale green-grey, dolomitic silty mudstones and siltstones.

No superficial deposits are indicated to overlie the site. However, the geological boundary of the Tidal Flat Deposits of the Holocene period is indicated to the west and southwest of the site boundary. Thin pockets/areas of these deposits, which typically comprise of soft clays with varying sand and silt, could overlie the solid strata, particular within the southwestern area of the site.

A variable thickness of made ground is anticipated above the in-situ deposits across the site associated within the construction of the pub and historical site uses. Deeper made ground would be anticipated within the footprint of the recently demolished pub, particularly if a cellar was present.

A summary of the anticipated geological succession is given below in Table 1.

4.2 GEOLOGY (CONTINUED)

Table 1 : Summary of Anticipated Site Geology		
Geological unit	**Horizon**	**Description**
Recent	Made ground	Various materials
Quaternary	Tidal Flat Deposits	Clays with varying sand and silt content
Early Devonian	St Maughan's Formation	Interbedded purple, brown and green sandstones and red mudstones
Triassic	Blue Anchor Formation	Pale green-grey, dolomitic silty mudstones and siltstones with thin argillaceous or arenaceous laminae

4.3 RADON

Information with regard to Radon Protective Measures is provided within the Envirocheck Report and the BGS Radon GeoReport as presented in Appendix C. The reports state that the site is within an intermediate probability area, as 5% to 10% of properties are above action level, meaning basic radon protective measures would be required.

However, the BGS Report shows that the majority of the site lies within a low probability area, meaning 0-1% of properties are above action level and that no radon protective measures would be required. Only a small section within the southwestern corner of the site would require basic radon protective measures.

The indicative site development plans which have been provided show that no houses are planned to be constructed within the southwestern corner of the site area where basic radon protective measures would be needed. Therefore, based on the indicative proposed development layout, no radon protective measures would be necessary in the construction of new buildings within the site.

4.4 MINING

The site is not located within an area that the would be affected by past, present or future underground mining.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK

The Envirocheck Report indicates the nearest surface water feature to be located onsite.

The OS Water Network Lines map indicates this to be an unnamed surface water feature that flows east to west through the southern part of the site. The watercourse is partially culverted within the central area of the site, with the western part and the very eastern most area an open watercourse. The flow direction of the watercourse is unknown, but likely to be towards the west.

The Natural Resources Wales groundwater vulnerability map and aquifer database classifies the bedrock, both the St Maughans Formation and the Blue Anchor Formation beneath the site as a Secondary 'B' Aquifer. Secondary B Aquifers are predominantly lower permeability layers which may store and yield limited amounts of groundwater due to localised features such as fissures, thin permeable horizons and weathering.

A perched water body could be anticipated in the made ground.

It is considered possible that the existing site drainage can act as a pathway for potential surface contaminants.

There are no recorded discharge consents recorded within 500m of the site boundary. The nearest discharge consent is located 560m southwest of the site boundary, where two discharge consents are present for a sewerage network.

The Envirocheck Report states that there are no groundwater abstractions within 1000m of the site.

Tables 2 and 3 present a summary of the hydrological features and key hydrogeological nature of the site.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

Table 2: Summary of Site Hydrology

Feature	Distance from site	Flow	Classification	Abstraction	Discharge
Unnamed Inland River	Onsite	Unknown	Drain	No	Unknown
Unnamed Inland River	90m East	Not known	Drain	No	Unknown
River Usk	>1000m	North	River	No	Bristol Channel
Surface run-off	On site	Flows into site drainage	N/A	No	Not known
Site Drainage	On site	Not known	N/A	No	Not known

Table 3: Summary of Site Hydrogeology

Geological Unit	Aquifer Classification	Aquifer Characteristics	Source Protection Zone	Groundwater Abstractions
Made ground	Not classified	Highly variable permeability and porosity. Perched water may be present with variable flow directions.	No	None
St Maughans Formation	Secondary 'B' Aquifer	Variable permeability interbedded sandstones, mudstones and conglomerates	No	None
Blue Anchor Formation	Secondary 'B' Aquifer	Variable permeability interbedded dolomitic silty mudstones and siltstones.	No	None

The Groundwater Vulnerability map of the area indicates the Secondary bedrock aquifer to have a high vulnerability. The pollutant speed is intermediate with well-connected fractures.

The Natural Resources Wales Flood Risk Map as presented within the Envirocheck Report indicates that the site is not at risk of extreme flooding from rivers or sea without defences.

The Natural Resources Wales Surface Water Flood Risk map as presented within the Envirocheck Report indicates that the majority of the site is not at risk of surface water flooding. However, the map indicates that the southern and eastern area of the site varies from a high risk to low risk of surface water flooding.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

The BGS Groundwater Flooding Susceptibility Map indicates the site to have no potential for groundwater flooding to occur at surface or below to property below ground level.

4.6 LANDFILL SITES

The Envirocheck Report states there are no recorded, current or historical landfill sites within 1000m of the site boundary.

The Envirocheck Report indicates that there is one area of potentially infilled land (water) recorded on site. The area is located within the southern area of the site at the location of a former inland river prior to it being straightened. There are no other areas of potentially infilled land (water) within 250m of the site boundary.

The Envirocheck Report indicates that there are no areas of potentially infilled land (non-water) located within 250m of the site boundary.

4.7 POTENTIAL CONTAMINATION

Previous Uses

The various activities in the vicinity of the site which may have resulted in ground or water resource contamination on this site are listed below in Tables 4 and 5. Reference to Department of the Environment Industry Profiles has been made and a summary of the potential contaminants can be found in the tables.

4.7 POTENTIAL CONTAMINATION (CONTINUED)

Table 4: Potential Contaminants		
Land Use: Green Fields and Hendre Farm until 1930s		
Material/Process	**Contamination/Hazard**	**Evidence**
Possible agricultural land	No potential contaminants	Historical maps
Construction of the building would have disturbed the ground and may have utilised imported materials of unknown origin	Metals, semi metals, non-metals, PAH, asbestos	Historical maps
Land Use: Expansion of Hendre Farm buildings in the 1930s		
Material/Process	**Contamination/Hazard**	**Evidence**
Construction of the buildings would have disturbed the ground and may have utilised imported materials of unknown origin	Metals, semi metals, non-metals, PAH, asbestos	Historical maps
Above ground storage tank of unknown use	Petroleum hydrocarbon	Historical maps
Demolition of the farm buildings in the 1960s would have further disturbed the ground and may utilised imported materials of unknown origin if any excavations required infilling following demolition	Metals, semi metals, non-metals, PAH, asbestos	Historical maps
Land Use: Construction of the Open Hearth Pub, filling station and associated car parking area in the 1970s		
Material/Process	**Contamination/Hazard**	**Evidence**
Construction of the building and filling station would have disturbed the ground and may have utilised imported materials of unknown origin	Metals, semi metals, non-metals, PAH, asbestos	Historical maps
Above ground and below ground storage tanks and underground pipelines associated with the filling station	Hydrocarbons – Fuels/oils	Historical maps
Demolition of the filling station and pub buildings which can caused further ground disturbance with possible contamination within any building fabric	Metals, semi metals, non-metals, PAH, asbestos and ACM within any residual building fabric if any remaining on site	Vacant Site Use

4.7 POTENTIAL CONTAMINATION (CONTINUED)

Existing Uses

The site has no current site uses with the former Open Hearth pub recently demolished. The current site uses would not add any additional contamination concerns.

Adjacent Site Uses

Table 5 : Potential Contaminants : Adjacent Site Uses

Potential Contamination Source	Boundary	Associated Contaminants and Hazards
Residential development with associated grounds	Eastern, Northern and Western	No Potential Contaminants
A48	Southern	No Potential Contaminants
Hendre Farm Drive	Northern and north western	No Potential Contaminants

4.8 OTHER ENVIRONMENTAL ISSUES

The Envirocheck Report indicates that environmentally sensitive land is located within 500m of the site boundary and consists of several areas of ancient woodland. The nearest is located 80m east of the site and is noted as ancient and semi-natural woodland.

The Envirocheck Report indicates that there have been no pollution incidents to controlled waters within 1000m of the site and no substantiated pollution incidents to controlled waters within 500m of the site.

The Envirocheck Report states that there are been no prosecutions relating to controlled waters or authorised processes within 1000m of the site.

There are no active trade directories onsite or within 250m of the site boundary.

It is not known if any invasive plant species are present, but the site is vegetated. It would be prudent to undertake a full vegetation survey prior to development.

5.0 PRELIMINARY CONCEPTUAL SITE MODEL

5.1 RISK ASSESSMENT FRAMEWORK

In order to be consistent with current UK government policies and legislation, it is necessary to identify, assess, estimate, evaluate, and take appropriate action to deal with land contamination, in accordance with the procedures specified in the Environment Agency guidance Land Contamination Risk Management (LCRM) published in October 2020. This replaces the now withdrawn 'Model Procedures for the Management of Land Contamination CLR-11' (Environment Agency 2004).

The risk assessment process is designed to provide a reasoned, structured and pragmatic mechanism for the identification of any potential human health and controlled waters risks associated with land contamination and where necessary to develop a robust remediation strategy to ensure protection of the sensitive receptors (human health of future residents, controlled waters, etc).

In accordance with LCRM, the term 'land contamination' is defined as:

- All land affected by contamination – land that might have contamination present which may, or may or may not, meet the statutory definition of contaminated land,
- Land determined as contaminated land under Part 2A of the Environmental Protection Act 1990.

LCRM provides a tiered approach to risk assessment, comprising a preliminary risk assessment (including the development of an initial conceptual site model), a generic quantitative risk assessment and a detailed quantitative risk assessment. For each tier of risk assessment, the following steps must be followed:

1. Identify the hazard - establish contaminant sources,
2. Assess the hazard – use a source-pathway-receptor linkage approach to determine if there is potential for unacceptable risk,
3. Estimate the risk – predict what degree of harm or pollution may result and how likely it is to occur, and
4. Evaluate the risk – decide whether a risk is unacceptable.

LCRM also provides definitions of the following terms:

- Hazard – a property or situation that in particular circumstances could lead to harm or pollution,

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

- Risk – a combination of the probability, or frequency of occurrence of a defined hazard and the magnitude of the consequences of the occurrence,
- Risk assessment – the formal process of identifying, assessing and evaluating the health and environmental risks that may be associated with a hazard,
- Risk management – the formal process to identify, assess and determine the risks, and to select and take action to mitigate them.

The three essential elements to any risk are defined by LCRM as follows:

- A contaminant, or pollutant, that is in, on, or under the land and that has the potential to cause harm, or pollution (Source)
- A route by which a receptor is, or could be affected by a contaminant (Pathway)
- A receptor, i.e. something that could be adversely affected by a contaminant, for example a person, controlled waters, an organism, an ecosystem, or Part 2A receptors such as buildings, crops or animals (Receptor).

In order for there to be a potential risk, all three of the above elements must be present. If there is a source of contamination and a receptor (for example a resident or site user), then there is only a potential risk if there is a pathway linking the two. Such an active pathway is known as a relevant pollutant linkage. It is possible for the same contaminant to be linked to a receptor via a number of pathways, and hence it is important that all relevant pollutant linkages, to both human health and controlled waters, are separately identified on a site in order that a comprehensive conceptual model can be formed and ultimately a robust remediation strategy designed.

Current practice during Generic Quantitative Risk Assessment of land affected by contamination is to use generic soil screening values based on the appropriate proposed end use. These usually comprise risk based Soil Guideline values (SGVs) or Generic Assessment Criteria (GACs) derived by the Environment Agency's Contaminated Land Exposure Assessment Model (CLEA). The SGVs and the supporting technical guidance were developed in order to assist in the assessment of long term risk to human health from the exposure to contaminated soils.

Revised Statutory Guidance, published in 2012, to support Part 2A of the Environmental Protection Act 1990, introduced a new four category system for classifying land under Part 2A. Category 1 includes land where the level of risk is clearly unacceptable and Category 4 includes land where the level of risk posed is considered to be acceptably low. Under Part 2A, land would be determined as contaminated if it falls within Categories 1 or 2.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

The revised Part 2A Statutory Guidance was accompanied by an Impact Assessment that identified a role for new 'Category 4 Screening Levels' (C4SLs) that would provide a simple test for determining when land is suitable for use and definitely not contaminated land. A Policy Companion Document including the C4SLs was published in March 2014 (England) and May 2014 (Wales).

The C4SLs have been based on the CLEA methodology and derived using the CLEA model, with modified toxicological and exposure parameters. To date, C4SLs have been released for six substances (arsenic, cadmium, chromium (VI), lead, benzo(a)pyrene and benzene).

The C4SLs have been derived on the assumption that where they exist, they will be used as generic screening criteria within generic quantitative risk assessment.

Following publication of the C4SLs, Land Quality Management (LQM), in conjunction with the Chartered Institute for Environmental Health (CIEH) released Suitable 4 Use Levels (S4ULs) in January 2015.

The S4ULs have been derived in accordance with UK legislation, and using a modified version of the Environment Agency's CLEA software. As such, the S4ULs are based on the concept of minimal or tolerable risk as described in Human Health Toxicological Assessment of Contaminants in Soil (Science Report SR2, Environment Agency 2009a).

S4ULs have been derived for a wider number of substances.

In addition to the existing SGVs, C4SLs and S4ULs, Atkins ATRISK^{soil} also provide a set of Soil Screening Values. These are currently intended to be used in conjunction with SGVs, although they intend to update these values in line with the C4SLs in due course.

We have reviewed all sets of values and intend to use the most appropriate assessment criteria as Tier 1 screening values in the first instance. Where a published S4UL is available, and considered appropriate, this will be used in the first instance.

5.2 CONCEPTUAL MODEL FRAMEWORK

The preliminary stage of the risk assessment process is to develop and define a conceptual site model, based on the desk study and any existing site investigation data. This is used to establish any potential contaminant sources, identify existing and future receptors and assess if there are any potentially active pathways by which a potential risk may be present.

5.2 CONCEPTUAL MODEL FRAMEWORK (CONTINUED)

The preliminary conceptual site model will be developed and refined as site specific data is gathered, such as actual ground conditions and chemical data, resulting in a more robust conceptual understanding of the site.

5.3 CRITICAL SENSITIVE RECEPTOR – HUMAN HEALTH

The proposed redevelopment of the site is for a residential end use. Therefore, the critical sensitive receptor from a human health perspective is an onsite residential receptor.

In accordance with S4UL/C4SL and CLEA guidance for a standard residential scenario, the critical sensitive receptor for a residential end use risk assessment is a female child, with exposure from 0 to 6 years.

The standard residential with home grown produce end use conceptual model defined by S4UL/C4SL and CLEA is assumed to be suitable for the purposes of this assessment.

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS

Based on the proposed redevelopment of the site for a residential end use, and the findings of the desk study, the critical sensitive receptor from a controlled water perspective is groundwater within the Secondary B Aquifer of the St Maughans Formation and the Secondary B Aquifer of the Blue Anchor Formation.

By considering groundwater as the critical sensitive receptor for controlled waters, the groundwater/hydrogeological risk assessment will also be protective of any nearby surface water features, of which one is located within the southern area of the site.

5.5 POTENTIAL CONTAMINANT SOURCES

As identified in the desk study, the extensive historical land uses at the site since the 1930's has resulted in a list of potentially contaminative uses that include the construction of the farm buildings, the Open Hearth Pub and operation of the filling station.

The potential types of contaminants of concern are listed below:

- Metals, semi-metals, and inorganics within the shallow made ground
- Polyaromatic hydrocarbons (PAH) within the shallow made ground
- Asbestos within the shallow made ground.

5.5 POTENTIAL CONTAMINANT SOURCES (CONTINUED)

In addition to the above, there could be the potential for petroleum hydrocarbons (VPH/EPH), and BTEX compounds within the made ground, particularly in the vicinity of former fuel tanks and/or pipelines associated with the filling station.

5.6 POTENTIAL EXPOSURE PATHWAYS

Potential exposure pathways for the critical receptors (both human health and controlled waters) are listed below:

- Dermal contact with soil and/or soil derived dust
- Ingestion of soil and/or soil attached to home-grown produce
- Ingestion of home-grown produce
- Inhalation of soil derived dust
- Inhalation of vapours – indoor and outdoor air
- Leaching of contaminants from made ground to groundwater
- Transportation of contaminants within groundwater.

In addition, the following exposure pathways have also been considered:

- Ground gas generation and migration
- Building materials durability.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL

A preliminary conceptual exposure model has been developed for the site. This is based on the findings of the desk study, historical review and site walk over and includes all potential sources, pathways and receptors that may be present on site. Those that have been identified as being potentially active require further investigation in the form of sampling and testing of soils and groundwater, followed by appropriate risk assessment.

The preliminary conceptual exposure model will be reviewed and refined following the completion of the site works and laboratory testing.

The preliminary conceptual exposure model is presented below in Table 6.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL (CONTINUED)

Table 6: Preliminary Conceptual Exposure Model

Source		Receptor	Pathway	Potentially Active Pathway?
Origin	Contaminant			
Made Ground of unknown origin and historical land uses	Metals, semi-metals, non-metals, PAH, Asbestos	Resident – human health	Dermal Contact with made ground/dust	✓
			Ingestion of soil and/or soil attached to home-grown produce	✓
			Ingestion of home-grown produce	✓
			Inhalation of dust	✓
			Inhalation of vapours – indoor/outdoor	✓
	Metals, semi-metals, inorganics, PAH,	Groundwater quality	Leaching from made ground	✓
	Metals, semi-metals, inorganics, PAH,	Surface water quality	Transportation within groundwater	✓
Underground and above ground storage/fuel tanks and within the vicinity of any associated pipework	Petroleum hydrocarbons, BTEX compounds	Resident – human health	Dermal Contact with made ground/dust	✓
			Ingestion of soil and/or soil attached to home-grown produce	✓
			Ingestion of home-grown produce	✓
			Inhalation of dust	✓
			Inhalation of vapours – indoor/outdoor	✓
	Petroleum hydrocarbons, BTEX compounds	Groundwater quality	Localised spillage	✓
	Petroleum hydrocarbons, BTEX compounds	Surface water quality	Transportation within groundwater	✓
Made Ground of unknown origin and natural ground	Metals, semi-metals, non-metals, PAH,	Building Materials Durability	Direct contact	✓
Ground Gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	✓

6.0 THE SITE INVESTIGATION

6.1 FIELDWORKS

A site investigation was designed in accordance with BS 5930:2015+A1:2020, the Code of Practice for Site Investigations, BS10175:2011+A2:2017, the Code of Practice for Investigation of Potentially Contaminated Sites, and 'Development of Land Affected by Contamination: A Guide for Developers' prepared by Welsh Local Government Association (WLGA)/Natural Resources Wales (NRW) Land Contamination Working Group, 2017.

The site investigation was also designed to provide information to support and refine the preliminary conceptual site model/conceptual exposure model.

An intrusive investigation comprising the drilling of five windowless sample boreholes and one hand excavated trial pit was carried out on the 4th of January 2023. The windowless sample boreholes were located across the site and drilled to refusal at a maximum depth of 3.7m below existing ground level. The purpose of the boreholes was to prove the shallow ground conditions and allow an assessment of the most appropriate foundation type for the proposed development. In situ strength testing (SPT/CPTs) was carried out at regular depth intervals in the boreholes.

A hang dug pit was undertaken in the northern area of the site to obtain a near surface sample as the sloping nature of the site prohibited the windowless sample rig entering the area.

Falling head permeability/soakaway tests were carried out in two boreholes in order to assess/monitor the likely permeability of the natural ground.

Representative soil samples were taken from the boreholes for laboratory chemical and geotechnical testing and placed in the appropriate sample containers deemed suitable for the analysis required. Strict protocols were adopted during this process to limit the cross contamination of samples.

The fieldworks were supervised by a qualified Geotechnical Engineer from Intégral Géotechnique (Wales) Limited who also logged the windowless sample boreholes and prepared their detailed engineering logs in accordance with the requirements of BS5930:2015+A1:2020. The engineering logs provide descriptions of the materials encountered in accordance with BSEN ISO 14688-1 (2002) and 14689-1 (2003) for soils and rocks respectively.

6.1 FIELDWORKS (CONTINUED)

The approximate locations of the windowless sample boreholes and the hand excavated trial pit are shown on Figure 2, while their logs are presented in Appendices D and E, respectively. The results of the falling head permeability/soakaway tests are presented in Appendix F.

6.2 FIELD OBSERVATIONS

No visual or olfactory evidence of any contamination was observed during the drilling of the windowless sample boreholes.

However, made ground was encountered at each exploratory location.

It should be noted that the site investigation works were limited to accessible areas of the site only. A large stockpile of demolition rubble was present within the footprint of the former Open Hearth pub building.

6.3 LABORATORY CHEMICAL TESTING

Representative soil samples were taken from the windowless sample boreholes across the site, stored at the appropriate temperature and dispatched to the laboratories of i2 Analytical for laboratory chemical testing within 24 hours.

The samples were tested for a range of contaminants that reflects the historical use of the site, the findings of the desk study and the preliminary conceptual site model/conceptual exposure model. A list of the soil testing carried out is given below:

Beryllium	Cadmium
Total Chromium	Hexavalent Chromium (VI)
Copper	Lead
Mercury	Nickel
Vanadium	Zinc
Arsenic	Boron
Selenium	Elemental Sulphur
Total Cyanide	Total Sulphate
Sulphide	Water Soluble Sulphate
pH	Monohydric Phenol
Polyaromatic Hydrocarbons (PAH)	Asbestos

The results of the laboratory testing are presented in Appendix G.

6.4 LABORATORY GEOTECHNICAL TESTING

Representative soil samples taken from the trial pits were dispatched to the MCERTS and UKAS accredited laboratories of Apex and tested for moisture content, Atterberg Limits, pH, water-soluble sulphate.

The results of the geotechnical testing are presented in Appendix H.

7.0 GROUND CONDITIONS

The trial pit logs should be referred to for detailed information on the encountered shallow ground conditions.

A summary of the ground conditions encountered across the site is presented below in Table 7.

Table 7 : Summary of Ground Conditions

Depth (m) From	To	Stratum
0.0	0.10	*SURFACE HARDSTANDING: Excluding WS01 and HD1* Bituminous Material.
0.0	0.2	*DISTURBED TOPSOIL: WS01 and HD1* Loose to medium dense dark brown very clayey gravelly sand. The gravel consisted of fine to coarse sub angular and angular mudstone with occasional plastic and brick fragments.
0.10/0.2	0.3/2.2	*MADE GROUND* Variable cohesive and granular soils containing man-made constituents such as slag, and clinker
0.3/2.2	>1.5/>3.7	*WEATHERED BEDROCK* Firm to stiff becoming stiff to hard red and orange brown clay with variable sand and gravel. Localised light green reduction spots were encountered with depth.

Windowless sample borehole sides were stable in the short term.

7.1 SURFACE HARDSTANDING

A surface covering of bituminous material was observed within windowless sample boreholes (WS02, WS03, WS04 and WS05) which was approximately 0.10m in thickness.

7.2 DISTURBED TOPSOIL

Disturbed topsoil was encountered from ground level to a depth of 0.2m below existing ground level within WS01 and HP1 within the northern area of the site.

The disturbed topsoil comprised of loose to medium dense dark brown very clayey gravelly sand. The gravel consisted of fine to coarse sub angular and angular mudstone with occasional plastic and brick fragments.

7.3 MADE GROUND

Made ground was encountered underlying the tarmac or disturbed topsoil at each windowless sample location to depths of between 0.3m and 2.2m below existing ground level.

The made ground was generally encountered to depths of between 0.3m and 1.0m below existing ground level with the exception of WS01 and WS04 with made ground encountered to depths of 1.65m and 2.2m below existing ground level, respectively.

Made ground was encountered to between 0.3m/1.0m depth within windowless sample boreholes WS02, WS03 and WS05 and typically comprised gravels and cobbles of angular and sub angular limestone and sandstone with some anthropogenic materials including brick, ash, clinker and slag.

Windowless sample borehole WS1 recorded made ground to a depth of 1.65m below existing ground level and comprised firm, becoming firm to stiff sandy gravelly clay with occasional brick, slag and clinker.

The greatest thickness of made ground was recorded within the vicinity of WS04, where made ground was encountered to a depth of 2.2m below existing ground level. The made ground was variable layers of typically loose to medium dense clayey gravel or soft silty gravelly clay with angular and sub angular limestone and mudstone with anthropogenic materials including brick, ash, clinker and slag.

7.4 WEATHERED BEDROCK

The made ground was underlain by weathered bedrock.

7.3 WEATHERED BEDROCK (CONTINUED)

The weathered strata was recorded in all windowless sample locations from depths ranging from 0.3m/2.2m below ground level and recorded to depths of >3.7m below existing ground level.

The completely weathered mudstone strata typically comprised of firm to stiff becoming stiff to hard red and orange brown friable silty clay with gravels of fine mudstone lithorelicts. Localised light green reduction spots were commonly encountered with depth. Locally the weathered strata was also slightly sandy.

The in-situ SPT tests undertaken within the windowless sample boreholes indicated an increase in stiffness with depth, with values ranging from 12 to 59, the average being 41.

The results of the Atterberg Limits testing indicates that the natural strata has plasticity indices ranging between 15% and 20%. The modified plasticity indices range between 9% and 15%, indicating that the natural strata vary from non-plastic to soils of low volume change potential.

The windowless sample logs and the hand excavated trial pit log are presented in Appendices D and E respectively.

7.5 GROUNDWATER

Groundwater was only encountered within one windowless sample borehole, WS05. Groundwater was encountered at 0.4mbgl and consisted of perched groundwater at the interface between the granular made ground and the cohesive low permeability underlying natural strata.

The groundwater conditions are based on observations made at the time of the fieldwork. It should be noted that groundwater levels may vary due to seasonal and other effects.

7.6 FALLING HEAD PERMEABILITY TESTING

Two falling head tests were undertaken at the site, within WS02 and WS05 respectively.

Both windowless sample boreholes were rapidly filled with water.

No infiltration was recorded in either test. This is likely due to the low permeability of the underlying weathered mudstone/stiff clay deposits.

7.6 FALLING HEAD PERMEABILITY TESTING (CONTINUED)

It should be noted that this initial testing should only be regarded as indicative.

The results of the falling head permeability tests are presented in Appendix F.

8.0 CONTAMINATION

8.1 AVERAGING AREAS

In order to assess the laboratory test results reliably and in context, the data have been grouped into an averaging area. An averaging area (or area of interest) is that area of soil to which a receptor is exposed or which otherwise contributes to the creation of hazardous conditions. This may be an area of historical industrial usage, a soil type, or a specific proposed end use.

In the case of this analysis, the averaging area has been determined according to the proposed residential end use.

8.2 SOIL CONTAMINATION

The Suitable 4 Use Levels (S4ULs) published by LQM have been adopted as critical concentrations against which soil contaminant concentrations can be compared. In the absence of additional published S4ULs, the Category 4 Screening Levels (C4SLs) derived by DEFRA and Soil Screening Values (SSVs) derived by Atkins ATRISK^{soil} for a residential with home grown produce end use have been adopted, where considered appropriate.

Since the results of the testing indicate total organic carbon content (TOC) in the range of 0.2% to 5.5%, the results have been compared to the respective guidelines, where applicable, for 1% soil organic matter content.

The soil test results for disturbed topsoil and made ground have been summarised and are shown in Appendices I and J, respectively.

8.2.1 Disturbed Topsoil

The results of the laboratory testing carried out on six representative samples of topsoil and subsoil indicate that the analysed chemical elements or compounds are present at concentrations below the appropriate thresholds.

Asbestos was not detected within any of the samples of disturbed topsoil.

8.2.2 Made Ground

The results of the laboratory testing indicate that most of the analysed chemical elements or compounds are present at concentrations below the appropriate thresholds. However, the initial screening indicates two exceedances of beryllium.

8.2 SOIL CONTAMINATION (CONTINUED)

Two elevated concentrations of beryllium were detected above the adopted screening values of 1.7mg/kg (LQM 1%SOM) within samples of made ground at WS03 (0.2mbgl) and WS04 (0.4mbgl), at concentrations of 5.6mg/kg and 7.7mg/kg respectively.

Asbestos was not detected within any of the samples of made ground.

No further exceedances were detected within the samples of made ground.

It should be noted that large areas of the site were inaccessible due to the presence of stockpiled demolition materials. Additionally, the presence and location of any former fuel storage tanks associated with the former filling station have not yet been confirmed and/or investigated.

8.2.3 In-situ Natural Ground

No visual or olfactory evidence of contamination of the in-situ natural ground was identified during the drilling of the boreholes. At the time of writing this report no samples of natural ground had been tested. It is considered likely that concentrations of determinands within the natural ground are likely to be naturally occurring and as such, the natural ground poses no significant threat to human health or the environment.

9.0 REVISED CONCEPTUAL EXPOSURE MODEL

The preliminary conceptual exposure model has been reviewed and revised to reflect the findings of the site investigation and the results of the laboratory testing of soil. Pathways identified as a relevant pollutant linkage require appropriate risk assessment or mitigation measures (see Section 10).

Table 8: Revised Conceptual Exposure Model

Source		Receptor	Pathway	Preliminary Active Pathway? (see Sect. 5.7)	Relevant Pollutant Linkage	Justification/ Mitigation
Origin	Contaminant					
Made Ground of unknown origin and historical land uses	Metals, semi-metals, non-metals, PAH, petroleum Asbestos	Resident – human health	Dermal Contact with made ground/dust	✓	✓	Elevated concentrations of beryllium identified within the made ground – risk assess. Note: footprint of the former pub was not investigated. It would be advised to do further analysis when demolition rubble has been cleared.
			Ingestion of soil and/or soil attached to home-grown produce	✓	✓	
			Ingestion of home-grown produce	✓	✓	
			Inhalation of dust	✓	✓	
			Inhalation of vapours – indoor/outdoor	✓	X	No sufficiently volatile contaminants identified.
	Metals, semi-metals, inorganics, PAH,	Groundwater quality	Leaching from made ground	✓	✓	Elevated concentrations of beryllium identified within the made ground – risk assess.
	Metals, semi-metals, inorganics, PAH, petroleum	Surface water quality	Transportation within groundwater	✓	✓	

9.0 REVISED CONCEPTUAL EXPOSURE MODEL (CONTINUED)

Source		Receptor	Pathway	Preliminary Active Pathway?	Relevant Pollutant Linkage	Justification/ Mitigation
Origin	Contaminant					
Underground and above ground storage/fuel tanks and within the vicinity of any associated pipework	Petroleum hydrocarbons, BTEX compounds	Resident – human health	Dermal Contact with made ground/dust	✓	✓	Access was not available at the time of the site investigation due to the presence of buried services. Following site clearance further sampling is recommended.
			Ingestion of soil and/or soil attached to home-grown produce	✓	✓	
			Ingestion of home-grown produce	✓	✓	
			Inhalation of dust	✓	✓	
			Inhalation of vapours – indoor/outdoor	✓	✓	
	Petroleum hydrocarbons, , BTEX compounds	Groundwater quality	Localised spillage	✓	✓	
	Petroleum hydrocarbons, , BTEX compounds	Surface water quality	Transportation within groundwater	✓	✓	
Made Ground of unknown origin and natural ground	Metals, semi-metals, non-metals, PAH,	Building Materials Durability	Direct contact	✓	✓	Building materials will be in contact with made ground – risk assess
Ground Gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	✓	✓	Made Ground on site risk assess

10.0 RISK ASSESSMENT

10.1 METHODOLOGY

The risk of pollution, health effects or environmental harm occurring as a result of ground contamination is dependent upon three principal factors:

- The scale of the contamination sources;
- The presence of sensitive “receptors”, eg Humans: health of the general public, site occupiers, redevelopment workers. Environment: flora, fauna, etc;
- The existence of migration pathways by which contaminants can reach the sensitive receptors.

This section assesses each of these factors in order to evaluate the overall level of risk and potential harm to receptors. The receptor may be human, a water resource, an eco-system or construction materials. Pathways connecting a perceived hazard to a receptor are referred to as exposure pathways.

The sources of contamination and the links connecting the hazards to the sensitive receptors will represent the basis for the risk assessment.

10.2 SOURCE-PATHWAY-RECEPTOR MODEL

The preliminary conceptual site model was based on the findings of the desk study. This was later reviewed and refined according to the findings of the site investigation, allowing for the ground conditions encountered and the results of laboratory testing of soil and groundwater. Any pathways considered to be inactive were removed from the model and all remaining potentially active pathways require risk assessment.

The pathways shown as potentially active in the Revised Conceptual Site Model in Section 9.0 above have been assessed below.

10.3 HUMAN HEALTH RISK ASSESSMENT

10.3.1 Site in its Present Condition

The site does not pose any risks to casual visitors or trespassers.

10.3 HUMAN HEALTH RISK ASSESSMENT(CONTINUED)

10.3.2 Future Site Users

The contamination test results and investigation observations show elevated concentration levels in the made ground (at shallow depth) of beryllium. None of the tested made ground samples were found to contain asbestos.

Given the elevated Beryllium concentrations within the general made ground encountered across the site, it is considered that a potential risk to human health may exist via the following relevant pollutant linkages:

- Dermal contact,
- Ingestion of soil or soil derived dust,
- Ingestion of soil attached to homegrown produce,
- Ingestion of homegrown produce,
- Inhalation of soil bourn dust.

The inhalation of vapours pathways (indoor and outdoor air) are not considered to be active since the contaminants of concern identified are not sufficiently volatile. Note that this should be reviewed following the recommended further contamination testing including an assessment of potential for petroleum hydrocarbons in the vicinity of the former fuel filling station and possible fuel storage tank area.

It is therefore considered necessary to protect end users from the elevated concentrations of beryllium in the shallow made ground. It is considered necessary to break the above listed relevant pollutant linkages in order to remove the potential risk.

It is recommended that a capping layer, of a minimum thickness of 600mm, of clean imported subsoil and topsoil is placed above a geotextile separation membrane in all private gardens and areas of soft landscaping. This would break all the above listed relevant pollutant linkages and removing the potential risk to future end users.

Following site clearance and breaking out of floor slabs and areas of hardstanding, it is recommended that additional sampling and testing is undertaken beneath the footprint of the former buildings with representative samples tested for further contamination including asbestos. Within the footprint of the former filling station the exposed formations should be inspected, sampled and tested for further contamination including petroleum hydrocarbons and asbestos.

10.3 HUMAN HEALTH RISK ASSESSMENT(CONTINUED)

Subject to the findings of the further investigation works in the vicinity of the former fuel filling station, it may be necessary to allow for appropriate validation sampling following removal of any below ground storage tanks and/or petroleum hydrocarbon hotspots.

It should be noted that this assessment should be reviewed to include the findings of the post site clearance supplementary testing following breaking out of floor slabs and areas of hardstanding, with specific testing in the areas of the former buildings and filling station. This assessment may therefore be subject to change.

10.3.3 Construction Workers

With future site development works involving the excavation and removal of the made ground, there would be a risk to workers from contaminants in the soils. Appropriate measures are therefore recommended for works involving the made ground materials which are known to be present beneath the site.

Normal good hygiene practices should be adequate to protect the health and safety of redevelopment workers, and should include:

- Minimum handling of materials;
- Washing of hands prior to all meal breaks, which should be taken in a designated clean area;
- The use of standard protective clothing such as boots and overalls and gloves, where considered relevant.

In dry weather, inhalation of dust and gases should be avoided preferably by the use of dust suppression techniques to minimise fugitive emissions and minimisation of exposed materials at any particular time.

All excavations should be regularly checked for safe atmospheres.

Additionally, a system should be established by which any ‘unusual’ materials that may be encountered are reported rapidly to the site management, so that the appropriate action may be taken, following specialist advice if necessary. An unusual material may be identified on site by colour, odour or physical nature.

Reference should be made to the Health and Safety Executive document “Protection of Workers and the General Public during the development of contaminated land” for detailed guidance on these matters.

10.4 RISKS TO VEGETATION

The concentrations of phytotoxic contaminants in the shallow made ground materials indicate the potential for adverse effects to vegetation. Similarly, the physical nature of the existing made ground does not provide a suitable growing medium for vegetation.

To ensure viable landscape areas by preventing upward migration of contaminants into the overlying soils, and in order to promote plant growth, any landscaped areas will require the provision of a minimum 600mm thick capping layer of clean, inert subsoil and topsoil materials above a geotextile membrane.

10.5 CONTROLLED WATERS RISK ASSESSMENT

Locally elevated concentrations of beryllium were encountered within the made ground.

The underlying natural ground comprised variable cohesive deposits with groundwater not encountered, with the exception of perched water encountered within WS05 at a depth of 0.4m at the interface between the granular made ground and low permeability natural soils.

In the developed state, the site will be covered by either the building footprint or areas of hardstanding and any gardens or areas of soft landscaping will be covered by a minimum 600mm thick capping layer of clean inert imported soils placed above a geotextile separation.

It is therefore considered that the potential for rainfall infiltration into the made ground, subsequent leachate generation from the made ground and the potential for vertical migration of unacceptable leachate concentrations to impact the underlying groundwater is considered to be low.

Based on the site conditions and development proposals, the risks to controlled waters is considered to be low at this stage.

However, the above assessment should be reviewed following the completion of the post site clearance supplementary site investigation works recommended in Section 10.3, with specific testing in the area of the former buildings and former filling station.

10.6 GROUND GAS RISK ASSESSMENT

The ground conditions encountered beneath the site comprise a variable thickness of made ground over weathered mudstone bedrock, comprising firm to stiff and stiff clay with mudstone lithorelicts.

10.6 GROUND GAS RISK ASSESSMENT (CONTINUED)

The made ground was found to comprise typically granular subbase materials and/or sandy gravelly clay with occasional brick, ash, slag and clinker. No evidence of potential gas producing materials such as wood, peat or other organic rich materials were observed.

However, the variable thickness of made ground encountered beneath the site and the potential extent of further made ground beneath the footprint of the former Open Hearth Public House building, including any potential infilled cellar may present a potential risk of ground gas.

Similarly, the historical maps have identified a former fuel filling station was previously located in the southeast part of the site. It is unknown if the former fuel storage tanks were above or below ground and if they have been appropriate decommissioned and removed, along with any associated pipework.

It is therefore recommended that allowances are made for further site investigation works in the area of the former public house and former filling station once these areas have been cleared and are accessible.

Allowances should be made for the installation of ground gas monitoring standpipes and undertaking a period of gas monitoring where thick made ground and/or evidence of any residual hydrocarbons or fuel storage tanks are confirmed.

No viable off-site sources have been identified within the vicinity of the site, with no recorded, historical or Local Authority landfill sites located within 500m of the site boundary.

As discussed above in Section 4.3, although the BGS Radon GeoReport indicates Basic Radon protective measures are required, the majority of the site is in an area where no radon protective measures are required. The requirement for basic radon protective measures affects a very small area within the southwestern corner of the site.

Based on the proposed indicated development layout plan provided, there are no buildings proposed in the southwest corner of the site and therefore, based on this, no radon protective measures are required within the buildings.

10.7 RISKS TO BUILDINGS AND MATERIALS DURABILITY

10.7.1 Concrete Classification

The results of the chemical testing of made ground and natural ground for water soluble sulphate and pH, which may adversely affect the durability of building materials is presented in Appendices G and H respectively.

Made Ground

Evidence to date does not indicate any specifically aggressive conditions, but it would be reasonable to expect a degree of sulphate and acidic aggressiveness from the made ground.

In accordance with BRE Digest SD1:2005 and adopting the assessment procedure specified therein for brownfield sites, the laboratory chemical test results indicate a characteristic value (taking the highest of the test results) for water soluble sulphate within the made ground of 480mg/l.

Using Table C2 of BRE Digest SD1:2005, this characteristic value corresponds to Design Sulphate Class DS-1.

The groundwater regime of the site has been assessed as 'mobile' and a characteristic pH value within the made ground of 8.2 has been determined (adopting the lowest test result). The Design Sulphate Class has been modified to give a site ACEC class of AC-1 for concrete structures constructed within the made ground.

Natural Ground

In accordance with BRE Digest SD1:2005 and adopting the assessment procedure specified therein for brownfield sites, the laboratory chemical test results indicate a characteristic value (taking the highest of test results) for water soluble sulphate within the natural ground of 43mg/l.

Using Table C2 of BRE Digest SD1:2005, this characteristic value corresponds to Design Sulphate Class DS-1.

The groundwater regime of the site has been assessed as 'mobile' and a characteristic pH value within the natural ground of 8.29 has been determined (adopting the lowest test results). The Design Sulphate Class has been modified to give a site ACEC class of AC-1 for concrete structures constructed within the natural ground.

10.7 RISKS TO BUILDINGS AND MATERIALS DURABILITY (CONTINUED)

10.7.2 Water Services

Water supply pipes will need to be protected from any contamination present within the ground. In particular, the presence of organic contaminants should be addressed when selecting pipe materials. Measures to protect the pipes will include clean backfill to trenches and possibly alternative material selection.

Reference should be made to UKWIR Guidance for the Selection of Water Supply Pipes to be used in Brownfield Sites, document No. 10/WM/03/21. The final design and selection of the pipe and associated backfill should be agreed with the appropriate Regulator prior to installation.

In order to comply with the UKWIR guidance, specific sampling and testing along the actual line of the proposed water supply route may need to be carried out once this has been established.

10.8 WASTE DISPOSAL

Excavated materials generated by the development may be considered as waste and subject to waste controls. Any re-use of excavated materials on-site should be undertaken in accordance with current waste and environmental legislation and which may require the production of an approved Materials Management Plan (MMP) prepared in accordance with the CL:AIRE Code of Practice.

It is recommended that a sustainable development strategy is adopted which reduces to a practicable minimum the generation of waste materials and the need for disposal to a licensed tip. Emphasis should be on recovery and re-use rather than disposal.

However, any waste or surplus materials that are generated will need to be classified in accordance with current EC regulations and Environment Agency guidance prior to disposal. It is the responsibility of the waste producer to classify the waste.

Based on the data obtained from the site investigation works, any waste materials comprising the existing made ground are likely to be classified as non-hazardous/hazardous waste. The existing natural ground are likely to be classified as non-hazardous waste.

Any asbestos containing materials (ACMs) will be classified as hazardous waste.

10.8 WASTE DISPOSAL (CONTINUED)

This classification is provisional and indicative of the likely waste classification based on the data obtained to date (including chemical composition, moisture content, etc.). It also assumes that the materials tested will be representative of future generated waste.

In order to minimise disposal, the materials generated should be segregated and examined, with appropriate testing as necessary, to enable the materials to be sorted or treated into lower classifications, with the resultant benefit of potentially generating re-use rather than disposal.

Once final waste sources and volumes are known, the waste stockpile to be disposed off-site will need to be classified in accordance with Environment Agency/Natural Resources Wales Waste Classification – Guidance on the Classification and Assessment of Waste Technical Guidance WM3 (2015). This is likely to require additional sampling and testing of the generated waste materials to provide an up to date current basis for classification.

Depending on the waste classification, waste acceptance criteria (WAC) testing may be required, in order to determine which class of landfill site the waste can be sent to.

It is recommended that the results of the waste classification and any WAC test results are sent to the intended licensed waste operator prior to disposal in order to confirm their classification and acceptance.

10.9 UNCERTAINTIES

It is important to recognise that there may be areas of contamination within the site that have not been found or that contaminants may be present at concentrations above those that have been found. It is also important to recognise that contamination may be localised and that no investigation, however comprehensive, is capable of finding such occurrences, other than by chance.

The ground beneath the former Open Hearth pub building has not been examined due to a large stockpile of demolition rubble positioned over the former building footprint. Due to the former use of the building as a former pub, a cellar or basement could be present but has not been proven at this stage.

The ground conditions and the presence or otherwise of any former above/below ground fuel storage tank and associated pipework, and any residual hydrocarbon contamination beneath the former filling station has not been investigated at this stage.

10.9 UNCERTAINTIES (CONTINUED)

The full thickness of the made ground beneath the former pub or within the area of the former filling station has not been proven at this stage.

11.0 ENGINEERING CONSIDERATIONS AND RECOMMENDATIONS

11.1 DETAILS OF PROPOSED DEVELOPMENT

A sketch layout for the scheme indicates that the proposed development will likely comprise of 32 units comprising a combination of low-rise properties and 2 to 3 storey apartment buildings. The development will also include associated access roads, car parking areas, private gardens and areas of soft landscaping. The sketch layout is shown on Le Truco Design Drawing No. LTS296.03.01, Revision B, dated July 2021. An extract of this layout plan is presented in Figure 3.

11.2 SITE PREPARATION

Prior to works commencing on site, any existing services within the site should be identified and either relocated or protected.

Any diversion works should be carried out under the supervision of, and to the specification of, the appropriate statutory authorities. The resulting excavations should be backfilled with suitable granular material laid and compacted to Department of Transport (DTp) Specification for Earthworks.

Any vegetation within the development area should be stripped off and stockpiled on site for off-site disposal. A full vegetation survey should be carried out prior to stripping works to assess the potential for any invasive plant species.

All fly tipped material should be appropriately disposed offsite.

The existing stockpile of demolition materials should be sorted and processed. Any unsuitable materials should be removed and disposed of offsite. Any oversized materials should be crushed to an appropriate grade, typically 125mm maximum particle size and stockpiled on site for reuse as granular fill.

Any existing hardstanding should be broken out and crushed to acceptable size for re-use. or alternatively disposed of offsite at a suitable facility. Any existing hardcore materials can similarly be recovered for re-use or alternatively disposed offsite.

Areas of tarmac/bituminous hardstanding should be planed off and set aside for re-use if the material is deemed appropriate or alternatively disposed offsite at a suitable facility.

11.2 SITE PREPARATION (CONTINUED)

Allowances should be made for removing any buried structures associated with the past usage of the site, if encountered. Any relict foundations, slabs, manholes, drainage runs, and all other buried structures should be demolished, removed and crushed to acceptable size for re-use or disposed off-site at a suitable facility.

The basement/cellar if present within the footprint of the Open Hearth Pub will need to be excavated out, the sides benched and the excavation backfilled in a controlled manner.

If there is insufficient space to bench or batter excavations, temporary and/or permanent support in the form of retaining walls/structures may be required, particularly where excavations are close to existing highways, footpaths and underground services.

All redundant footings, services and remaining surface hardstanding associated with the former buildings and site usage will need to be broken out with the resulting debris crushed and screened to a structural specification, typically 125mm maximum particle size.

The resultant voids from the demolition works should be brought back up to the required level with well compacted suitable granular materials, laid and compacted in layers and benched into the surrounding soils. Department of Transport (DTp) Type 1 sub-base or similar approved, could be used and should be compacted in layers, in accordance with DTp Specification for Highway Works.

In addition, the surface drains that cross the site, including the watercourse/drain that crosses the southern area of the site, should be protected from any detrimental effects (including pollution and ground settlements) during construction works.

The exposed formations should be checked, and any soft spots/areas should be removed and replaced with well compacted site won or imported granular fill material where practical.

A system should be established for identification and dealing with any unforeseen contamination encountered during the site works (including identification of any potential asbestos containing materials and/or any residual hydrocarbons in the former fuel filling station part of the site). Any contamination, or suspected contamination, should be reported to the site manager, so that appropriate action may be taken, following specialist advice if necessary.

Subject to the findings of the recommended post clearance supplementary site works, allowances should also be made for removal of any identified underground fuel storage tanks and associated fuel lines, followed by appropriate validation testing.

11.2 SITE PREPARATION (CONTINUED)

During site clearance and subsequent operations airborne nuisance caused by dust from site must be controlled on account of the health and safety of site operatives and existing neighbouring residents.

Due to the sloping nature of the site, some degree of cut and fill earthworks is required.

If any fill is to be placed onto an existing sloping area, then original ground should be adequately benched, in order to prevent the possibility of slippage at the interface between the new fill and the original ground. All works should be carried out in accordance with the Department of Transport (DTp) Specification for Highway Works.

Any cut and/or fill slopes should be no steeper than 1v in 2h. Cut off drains should be provided at the top and French drains at the bottom of any cut and/or fill slopes.

In areas of cut and/or fill, the slope should be topsoiled and seeded with grass, in order to minimise any future maintenance problems caused by surface water run-offs.

Any exposed formations should be proof rolled, soft spots removed and replaced with structural fill placed in accordance with the Department of Transport Specification for Highways Works

During the earthworks operations to achieve a reduced development plateau, allowances should be made for potentially encountering boulders, cobbles and any residual obstructions at shallow depth.

Allowances should also be made for encountering perched groundwater and shallow groundwater.

The boundaries of the site to the south and west contain mature trees. Allowances should therefore be made for the removal of any associated roots that may become exposed in any proposed nearby earthworks and foundation excavations. Any such works should be conducted in accordance with the code of practice recommended by the National House Building Council (NHBC). All protection orders relating to existing vegetation/ecology should be adhered to during the development of the site.

11.3 FOUNDATIONS AND FLOOR SLABS

It is recommended that further investigation is undertaken to confirm the ground conditions beneath the area of the former filling station and the former pub building, including confirmation or otherwise if a cellar/basement is/was present beneath the former pub.

It should be noted that the following foundation recommendations should be reviewed following completion of the recommended further intrusive works and once the final development layout and site engineering levels have been confirmed.

The ground conditions generally comprised of made ground to variable depths of between 0.3m/2.2m over stiff silty clays.

Based on the ground conditions encountered to date, it is considered that conventional strip/trench fill foundations could be used for the proposed buildings, founding within the in situ natural strata. All strip/trench fill foundations should completely bypass any made ground and be constructed within competent natural insitu strata comprising the firm becoming stiff clay deposits detailed above.

At this stage, an allowable bearing pressure of 100kN/m^2 could be used for design purposes. At this intensity of loading, total settlements should not exceed 25mm, and any angular distortions caused by differential movements should be less that 1:750.

Foundations should penetrate the founding strata by a minimum of 200mm and be at a minimum depth of 900mm below development level in order to protect against the effects of frost heave and/or thermal shrinkage.

Foundations should be deepened to fully penetrate any encountered soft/loose natural deposits, and any encountered made ground.

All strip/trench fill foundations for individual buildings should be constructed within uniform strata in order to minimise the potential for differential settlement. There should be no spanning of foundations between soils of different strengths. If there are significant changes in the bearing strata beneath foundations, then footings should include suitably designed mesh reinforcement, both top and bottom, to mitigate the risks of relative deflection.

Laboratory Atterberg Limits have been determined for the natural strata underlying the site. The results indicate a low volume change potential. Footings should be appropriately deepened in accordance with NHBC guidance for foundations constructed in low volume change potential soils within influencing distance of trees and hedges.

11.3 FOUNDATIONS AND FLOOR SLABS (CONTINUED)

Deeper foundation depths may be required where founding horizons may need to be taken down below any root system or in areas of placed fill.

If the thickness of the made ground precludes the use of strip/trench fill foundations then consideration will need to be given to alternative foundations such as the use of raft foundations on engineered fill or piled foundations This should be reviewed following completion of the recommended further site investigation works.

Floor slabs should be designed and constructed as suspended.

The findings of the BGS Radon GeoReport indicate that no radon measures are required. The requirements for any ground gas protective membranes to be included in the ground floor slab construction would be determined following completion of the recommended supplementary site investigation works.

11.4 EXCAVATIONS AND FORMATIONS

Most excavations should be possible with normal soil excavating machinery. However, allowances should be made for the use of pneumatic breaker attachments, or similar tools, to deal with any residual buried obstructions.

The stability of excavations will likely be variable and significant instability should be expected in the existing made ground.

The sides of excavations should be supported by trench boxes, or battered at gradients of typically 30˚, subject to appropriate risk assessments.

On the basis of the site investigation findings, excavations down to depths of the windowless sample boreholes are generally unlikely to encounter significant groundwater inflows other than the localised perched water inflows associated with seasonal rainfall. Any perched groundwater inflows will require controlling.

Perched groundwater should be anticipated in the vicinity of any buried structure i.e. foundations, drainage trenches etc.

It is considered that any groundwater inflows/seepages if encountered are likely to be slight and these together with any rainfall infiltrations should be dealt with by conventional pumping techniques. It should be noted that groundwater levels can vary depending on seasonal variations and other factors.

11.4 EXCAVATIONS AND FORMATIONS (CONTINUED)

Any soft spots/areas should be removed and replaced with compacted imported granular material.

11.5 ACCESS ROADS AND CAR PARKING AREAS

Any existing foundations, slabs and other hard surfacing should be broken out beneath all highway, drive and car parking areas.

The existing made ground is variable and comprises both granular and cohesive materials. There are therefore likely to be variations in the strength of the materials at the formation levels and therefore for the access road and car parking formations, a California Bearing Ratio (CBR) value of between 1% and 2% could be used for design purposes.

Materials should be considered frost susceptible.

After proof rolling the formations, any 'soft spots/areas' should be removed and replaced with well compacted imported granular materials. Department of Transport (DTp) Type 1 sub-base, or similar approved, could be used and should be compacted in layers, in accordance with the DTp Specification for Highways Works.

It should be noted that the Local Highway Authority may insist that field CBR tests should be carried out to confirm the above recommendations. Allowances should therefore be made for carrying out such tests and any further works which the Local Authority may require as a result of these tests.

Allowances should be made for undertaking field CBR tests in order to confirm the above assumptions. Depending on the outcome of such field tests, the above recommendations may be revised, if necessary, amended.

11.6 RETAINING WALLS

During the recent intrusive investigation access along the proposed route of the retaining walls were limited due to the gradient of the existing slope in the northern area and presence of buried services.

It is therefore recommended that following site clearance, further investigation is undertaken along the route of the proposed retaining structures, to confirm the underlying ground conditions.

11.6 RETAINING WALLS (CONTINUED)

However, based on the intrusive site investigation to date, where it is proposed to retain existing ground or any imported granular fill by means of retaining walls, then for preliminary design purposes the following shear strength parameters may be used for the design of the retaining walls.

C' =	0,	Ø'	=	20^o for in-situ cohesive superficial materials
C' =	0,	Ø'	=	25^o for in-situ granular superficial materials
C' =	0,	Ø'	=	32^o for well compacted acceptable structural fill

Drainage measures should be incorporated into the design and construction of the retaining walls, in order to ensure that there is no build-up of any hydrostatic water pressure behind the walls.

Temporary support may be required during the construction of any retaining walls. All retaining walls should be founded on competent in-situ natural soils.

11.7 DRAINAGE

Two falling head permeability tests were undertaken within windowless sample boreholes WS02 and WS05.

No infiltration was recorded in either test. This is likely due to the low permeability of the underlying weathered mudstone/stiff clay deposits.

It should be noted that this initial testing should only be regarded as indicative.

If it should be proposed to use soakaways for this site, then more extensive location and depth specific follow-up tests will be required and should fully comply with BRE 365, in order to confirm the suitability of the site and to satisfy the local authority.

11.8 RECOMMENDED FURTHER WORKS

Once access is available the ground conditions beneath the former buildings and filling station should be confirmed.

Following site clearance and breaking out of floor slabs and areas of hardstanding, it is recommended that additional sampling and testing is undertaken beneath the footprint of the former buildings with representative samples tested for further contamination including asbestos.

11.8 RECOMMENDED FURTHER WORKS (CONTINUED)

Within the footprint of the former filling station the exposed formations should be inspected, sampled and tested for further contamination including petroleum hydrocarbons and asbestos.

Subject to the findings of the recommended post clearance supplementary site investigation works, if any underground fuel storage tanks are identified within the site, allowances should be made for their removal and appropriate validation testing.

Given the thickness of made ground identified in the southwest area of the site, and the potential for made ground beneath the former pub building, a programme of ground gas monitoring should be carried out in order to satisfy the regulators.

APPENDIX A

NEWPORT CITY COUNCIL REGULATORY SEARCHES

Lowri Williams

From: Manning, Steve (Senior Scientific Officer) <Steve.Manning@newport.gov.uk>
Sent: 22 February 2023 17:13

Sent: 22 February 2023 10:45
To: 'lauren@integralgeotec.com' <lauren@integralgeotec.com>
Subject: The Open Hearth, Hendre Farm Drive, Newport

Dear Lauren

Thank you for your request and payment for a search in relation to the above site.

I have looked at the information we hold and can confirm that land at The Open Hearth, Hendre Farm Drive, Newport (outlined in green on mapping below) is not the subject of any contaminated land investigations and has not been determined as contaminated land.

Answers to the specific questions selected are provided below:

Question 1
Details of any petroleum storage including details of tank decommissioning (refer to Petroleum Licensing Officer)

With petroleum officer for comment. To be confirmed.

Question 2
Has any area of the site been determined as Contaminated Land under Part IIA of the Environmental Protection Act 1990?

No

Question 3
Do you have any information on historical or current contamination at or within 250m of the subject site arising from former site use or surrounding area activities?

Former land uses within 250 metres are limited to the site of Hartridge School where fuel storage tanks were present and some historic hydrocarbon observations reported. No further details of this are held on our system.

Question 4
Details of any Pollution Prevention and Control Act records / other permits or licenses held for the property.

None

Question 5
Do you have any particular concerns regarding pollution (former pollution incidents etc) or statutory nuisance relating to the property?

None currently.

Further information or comments regarding this request:
We are currently doing a desk study for a site in Ringland, Newport and have just noticed a filling station was formally present on site on one of the site history maps in the 1970s. Would it be possible to be provided with any further information?

Petroleum officer comments in 1. Above should cover any wider information we may hold.

Informative.
This information is provided after appropriate enquiries and represents a summary of the information available to this department at the time of the enquiry. It is provided on the understanding that the council does not guarantee its accuracy. Neither the council, any officer or agent is legally responsible for any discrepancy, error or omission; whether arising from inaccuracy, negligence or any other cause whatsoever.

Kind Regards
Steve

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Monmouthshire

Published 1886 - 1887

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Published 1938

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Newport

Published 1983

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2022

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Published 1964

Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1987

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	-
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	2
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	3
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Historical Map List	5
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Integral Geotechnique (Wales) Ltd
Integral House
7 Beddau Way
Caerphilly
CF83 2AX

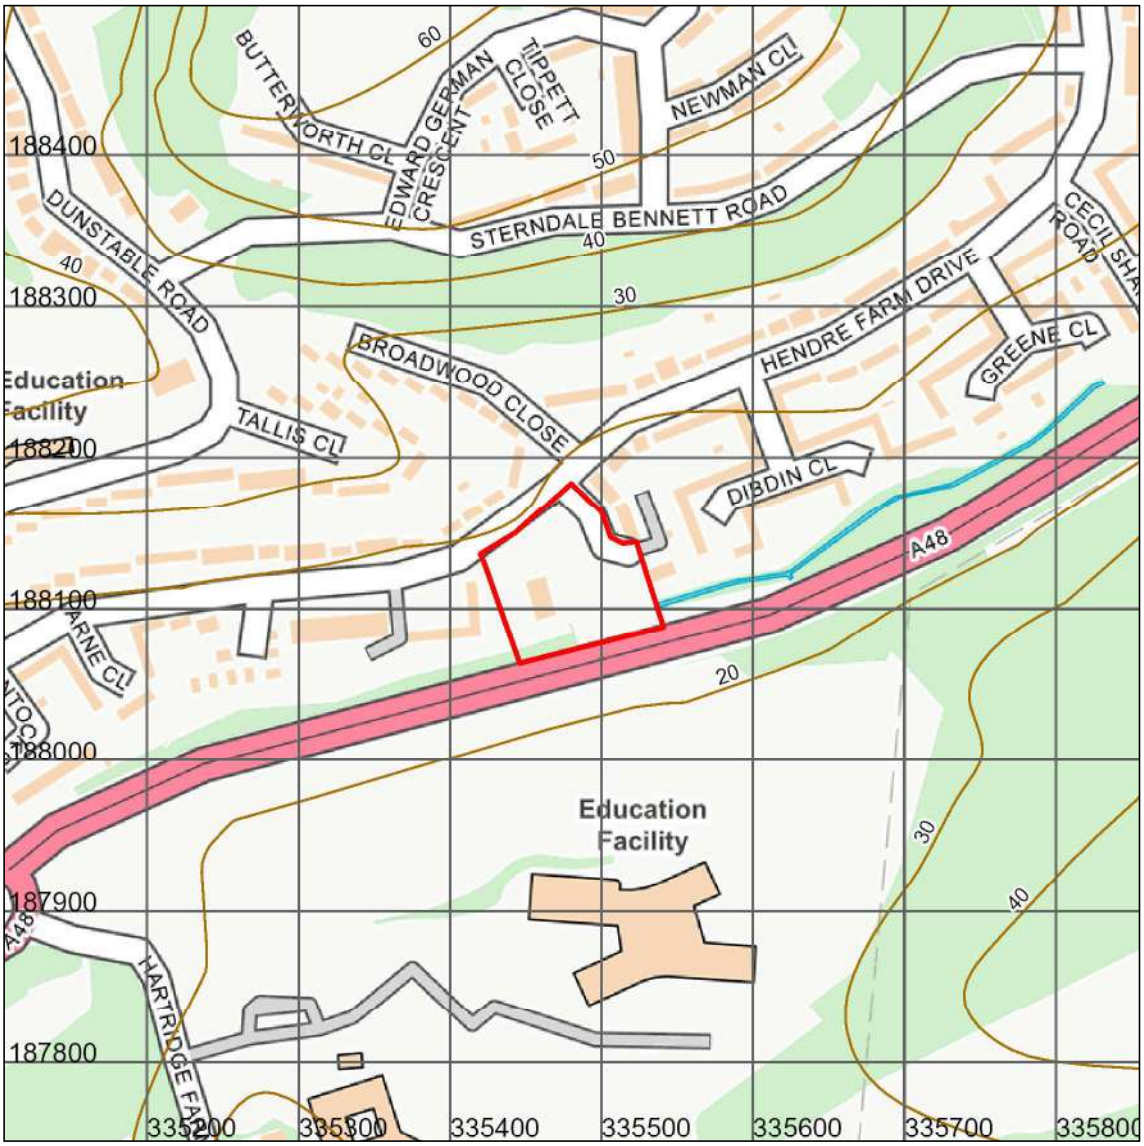
Radon Report

Advisory report on the requirement for radon protective measures in new buildings, conversions and extensions to existing buildings. The report also indicates whether a site is located within a radon Affected Area

Report Id: ***BGS_330215/41061***

Client reference: 14144 Open Hearth

Search location



Contains OS data © Crown Copyright and database right 2023. OS OpenMap Local: Scale: 1:5 000 (1cm = 50 m)
Search location indicated in red

This report describes a site located at National Grid Reference 335480, 188124. Note that for sites of irregular shape, this point may lie outside the site boundary. Where the client has submitted a site plan the assessment will be based on the area given.

Radon Report: UK

When extensions are made to existing buildings in high radon areas, or new buildings are constructed in these areas, the Building Regulations for England, Wales, Scotland and Northern Ireland require that protective measures are taken against radon entering the building.

This report provides information on whether radon protective measures are required. Depending on the probability of buildings having high radon levels, the Regulations may require either:

1. No protective measures
2. Basic protective measures
3. Full protective measures

This is an advisory report on the requirement for radon protective measures in new buildings, conversions and extensions. The report also indicates whether a site is located within a radon Affected Area

Requirement for radon protective measures

The determination below follows advice in *BR211 Radon: Guidance on protective measures for new buildings (2015 edition), which also provides guidance on what to do if the* result *indicates that protective measures are required.*

Is the property in an area where radon protective measures are required for new buildings or extensions to existing ones as described in publication BR211 (2015 edition) Radon: Guidance on protective measures for new buildings?

BASIC RADON PROTECTIVE MEASURES ARE REQUIRED FOR THE REPORT AREA.

More details of the protective measures required are available in *BR211 Radon: Guidance on protective measures for new buildings (2015 Edition)*. Additional information and guidance is available from the Building Research Establishment website (http://www.bre.co.uk/radon/).

Whether or not the radon level in a building is above or below the radon Action Level can only be established by having the building tested. The UKHSA provides a radon testing service which can be accessed at www.ukradon.org or by telephone (01235 822622).

If you require further information or guidance, you should contact your local authority building control officer or approved inspector.

Radon Affected Area

	% Homes estimated to be at or above the action level
	0-1%
	1-3%
	3-5%
	5-10%
	10-30%
	30-100%

Scale: 1:10 000 (1cm = 100 m)
Search area indicated in red

Is the property in a radon Affected Area as defined by the UK Health Security Agency (UKHSA) and if so what percentage of homes are estimated to be at or above the Action Level? **YES**

Additional Information

THE PROPERTY IS IN A RADON AFFECTED AREA WHERE 5 TO 10% OF HOMES ARE ESTIMATED TO BE AT OR ABOVE THE ACTION LEVEL.

The UKHSA recommends a radon 'Action Level' of 200 Becquerels per cubic metre of air (Bq m^{-3}) for the annual average of the radon gas concentration in a home. Where 1% or more of homes are estimated to be at or above the Action Level the area should be regarded as a radon Affected Area.

This report informs you whether the property is in a radon Affected Area and the percentage of homes that are estimated to be at or above the radon Action Level at this location. Being in an Affected Area does not necessarily mean there is a high radon level within the property; the only way to determine the radon level is to carry out a radon measurement.

The UKHSA advises that radon gas should be measured in all properties within radon Affected Areas and that homes with radon levels at or above the Action Level (200 Bq m^{-3}) should be remediated. Householders with levels between the Target Level (100 Bq m^{-3}) and Action Level should seriously consider reducing their radon level, especially if they are at greater risk, such as if they are current or ex smokers. Whether or not a home is in fact above or below the Action Level or Target Level can only be established by having the building tested. The UKHSA provides a validated radon testing service which can be accessed at www.ukradon.org.

The information in this report provides an answer to one of the standard legal enquiries on house purchase in England and Wales, known as Law Society CON29 Enquiries of the Local Authority (2016); 3.14 Radon Gas: Do records indicate that the property is in a “Radon Affected Area” as identified by the UKHSA. The data can also be used to advise house buyers and sellers in Scotland and Northern Ireland.

If you are buying a new build property in a Radon Affected Area, you should ask the builder whether radon protective measures were incorporated in the construction of the property.

If you are buying a currently occupied property in a radon Affected Area, you should ask the present owner whether radon levels have been measured in the property. If they have, ask whether the results were at or above the radon Action Level and if so, whether remedial measures were installed, radon levels were re-tested, and if the results of re-testing confirmed the effectiveness of the measures.

Further information on radon is available from the UKHSA at www.ukradon.org.

What is radon?

Radon is a naturally occurring radioactive gas, which is produced by the radioactive decay of radium which, in turn, is derived from the radioactive decay of uranium. Uranium is found in small quantities in all soils and rocks, although the amount varies from place to place. Radon released from rocks and soils is quickly diluted in the atmosphere. Concentrations in the open air are normally very low and do not present a hazard. Radon that enters enclosed spaces such as some buildings (particularly basements), caves, mines, and tunnels may reach high concentrations in some circumstances. The construction method and degree of ventilation will influence radon levels in individual buildings. A person's exposure to radon will also vary according to how particular buildings and spaces are used.
Inhalation of the radioactive decay products of radon gas increases the chance of developing lung cancer. If individuals are exposed to high concentrations for significant periods of time, there may be cause for concern. In order to limit the risk to individuals, the Government has adopted an Action Level for radon in homes of 200 becquerels per cubic metre (Bq m^{-3}). The Government advises householders that, where the radon level is at or above the Action Level, measures should be taken to reduce the concentration.

Radon in workplaces

The Ionising Radiation Regulations 2017 require employers to take action when radon is present above a defined level in the workplace. Advice may be obtained from your local Health and Safety Executive Area Office or the Environmental Health Department of your local authority. The BRE publishes a guide (BR293)**: Radon in the workplace.** BRE publications may be obtained from the BRE Bookshop, Tel: 01923 664262, email: bookshop@bre.co.ukwebsite: www.brebookshop.com

Terms and Conditions

General Terms & Conditions

This Report is supplied in accordance with the GeoReports Terms & Conditions available on the BGS website at https://shop.bgs.ac.uk/georeports and also available from the BGS Enquiry Service at the above address.

Important notes about this Report

- The data, information and related records supplied in this Report by BGS can only be indicative and should not be taken as a substitute for specialist interpretations, professional advice and/or detailed site investigations. You must seek professional advice before making technical interpretations on the basis of the materials provided.
- Geological observations and interpretations are made according to the prevailing understanding of the subject at the time. The quality of such observations and interpretations may be affected by the availability of new data, by subsequent advances in knowledge, improved methods of interpretation, and better access to sampling locations.
- Raw data may have been transcribed from analogue to digital format, or may have been acquired by means of automated measuring techniques. Although such processes are subjected to quality control to ensure reliability where possible, some raw data may have been processed without human intervention and may in consequence contain undetected errors.
- Detail, which is clearly defined and accurately depicted on large-scale maps, may be lost when small-scale maps are derived from them.
- Although samples and records are maintained with all reasonable care, there may be some deterioration in the long term.
- The most appropriate techniques for copying original records are used, but there may be some loss of detail and dimensional distortion when such records are copied.
- Data may be compiled from the disparate sources of information at BGS's disposal, including material donated to BGS by third parties, and may not originally have been subject to any verification or other quality control process.
- Data, information and related records, which have been donated to BGS, have been produced for a specific purpose, and that may affect the type and completeness of the data recorded and any interpretation. The nature and purpose of data collection, and the age of the resultant material may render it unsuitable for certain applications/uses. You must verify the suitability of the material for your intended usage.
- If a report or other output is produced for you on the basis of data you have provided to BGS, or your own data input into a BGS system, please do not rely on it as a source of information about other areas or geological features, as the report may omit important details.
- The topography shown on any map extracts is based on the latest OS mapping and is not necessarily the same as that used in the original compilation of the BGS geological map, and to which the geological linework available at that time was fitted.
- Note that for some sites, the latest available records may be historical in nature, and while every effort is made to place the analysis in a modern geological context, it is possible in some cases that the detailed geology at a site may differ from that described.

Project Name: **Open Hearth, Ringland**		Project No.: **14144**	Borehole No.: **WS05** Sheet 1 of 1
Location: Newport	Client: Willis Construction	Coordinates:	Hole Type: WLS
Equipment: DART 346	Diameter of Casing:	Level:	Scale 1:25
Diameter of Boring: 101+97mm	Depth of Casing:	Dates 04/01/2023 -	Logged By: LS

Well	Water Strikes	Samples & In situ Testing: Depth (m)	Type	Results	Depth (m)	Level (m AOD)	Legend	Stratum Description
					0.10			(MADE GROUND) Bituminous Material.
		0.30	ES					(SUB BASE) Compact orange and beige clayey slightly sandy GRAVEL of fine to coarse sub angular and angular limestone.
	0.40 ▼				0.40			Firm becoming stiff orange brown silty friable CLAY with occasional light green spots.
		1.00	C	N=51 (7,9/10,11,14,16)	1.00			Stiff becoming hard of gravelly silty CLAY. Gravel is fine to coarse sub angular and angular mudstone.
		1.10	D					
		1.30	C	50 (17,19/50 for 100mm)				
					1.50			End of Borehole at 1.50 m

Remarks:

1. Windowless sample borehole refused at 1.5mgl. 2. Perched groundwater encountered at 0.4mbgl.

Key:

D - Small disturbed sample
B - Bulk disturbed sample
ES - Environmental soil sample
SPT - Standard Penetration Test (split spoon)
CPT - Standard Penetration Test (solid cone)
W - Water sample
U - Undisturbed sample
TCR - Total Core Recovery
SCR - Solid Core Recovery
RQD - Rock Quality Designation

Project Name:	Project No.:	Trial Pit No.:
Open Hearth, Ringland	**14144**	**HD1** Sheet 1 of 1

Location:	Client:	Logged By:	Scale
Newport	Willis Construction	LS	1:25

Equipment: Hand Excavated

Coordinates:

Date Excavated: 04/01/2023

Level:

Dimensions

0.10m

Depth : 0.20m

0.10m

Samples & In-situ Testing			Depth (m)	Level (m AOD)	Legend	Stratum Description
Depth (m)	Type	Results				
0.10	ES		0.20			(Disturbed Topsoil) Loose to medium dense dark brown very clayey gravelly SAND with frequent rootlets. Gravel is fine to coarse sub angular and angular mudstone with occasional plastic.
						End of Trialpit at 0.20 m

1
2
3
4
5

Remarks:

1. Hand excavated trial pit terminated at 0.3mbgl, environmental sample collected. 2. No groundwater encountered.

Groundwater: No groundwater encountered.

Stability: Trial pit sides were stable in the short term.

Key:

D - Small disturbed sample
B - Bulk disturbed sample
ES - Environmental soil sample
W - Water sample

Analytical Report Number : 23-10727

Project / Site name:	Open Hearth, Ringland, Newport	**Samples received on:**	06/01/2023
Your job number:	14144	**Samples instructed on/ Analysis started on:**	09/01/2023
Your order number:		**Analysis completed by:**	18/01/2023
Report Issue Number:	1	**Report issued on:**	18/01/2023
Samples Analysed:	6 soil samples		

Signed:

Joanna Wawrzeczko
Reporting Specialist
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement.
Application of uncertainty of measurement would provide a range within which the true result lies.
An estimate of measurement uncertainty can be provided on request.

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Water matrix abbreviations:
Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Waters (PrW) Final Sewage Effluent (FSE) Landfill Leachate (LL)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with dispersion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
Loss on ignition of soil @ 450oC	Determination of loss on ignition in soil by gravimetrically with the sample being ignited in a muffle furnace.	In house method.	L047-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In house method.	L099-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Total Sulphur in soil	Determination of total sulphur in soil by extraction with aqua-regia, potassium bromide/bromate followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In house method.	L009-PL	D	MCERTS
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in NaOH and addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS

Analytical Report Number : 23-10727
Project / Site name: Open Hearth, Ringland, Newport

Water matrix abbreviations:
Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Waters (PrW) Final Sewage Effluent (FSE) Landfill Leachate (LL)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status

For method numbers ending in 'UK or A' analysis have been carried out in our laboratory in the United Kingdom (WATFORD).
For method numbers ending in 'F' analysis have been carried out in our laboratory in the United Kingdom (East Kilbride).
For method numbers ending in 'PL or B' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC
Unless otherwise indicated, site information, order number, project number, sampling date, time, sample reference and depth are provided by the client. The instructed on date indicates the date on which this information was provided to the laboratory.

CERTIFICATE OF ANALYSIS

Date of report Generation:	24 January 2023
Customer:	Apex Testing Solutions Limited
Sample Delivery Group (SDG):	230119-51
Your Reference:	D23019
Location:	Open Hearth, Ringland, Newport
Report No:	676148
Order Number:	ATS 1758

We received 3 samples on Thursday January 19, 2023 and 3 of these samples were scheduled for analysis which was completed on Tuesday January 24, 2023. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.
The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Lab Sample No(s)	Customer Sample Ref.	Depth (m)	Colour	Description	Inclusions	Inclusions 2
27429372	WS01	1.70 - 1.70	Dark Brown	Sandy Clay Loam	Stones	Vegetation
27429374	WS03	1.50 - 1.50	Dark Brown	Clay	Stones	None
27429376	WS05	1.10 - 1.10	Dark Brown	Clay	None	None

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally ocurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Appendix

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 30 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of one month after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.
