Dear Marnie / Tree team (FAO Paul Kane NCC)

We've had some responses from our design team and consultants to your requests as agree with James @ TCC. Please see below to responses.

1. Where will the contractors compound be and how will they access the work area? Attached
2. What equipment is going where? This needs to be shown overlaid with the tree rooting areas. Can this be drawn onto the site layout? Tree info attached. Attached
3. What excavations and where, again with cross sections and levels shown in relation to rooting areas. There will need to be methods supplied for these also. Attached
4. What methods of excavation and anchorage are to be used and in what areas? **Tarmac will be cut and broken out, post holes will be hand dug and posts will be concreted into the ground.**
5. Any changes to fences/boundary structures? **This is shown in the report, it will be sweet chestnut posts with 2 half round chestnut rails.**
6. A list of anything happening in marked tree rooting areas so they are aware of what the AWB will be there to oversee. **Rubber over tarmac and existing rubber which is trowelled on, no machinery used.**

7. A list of expected wheeled or tracked equipment on site for the project and where/how it is to be used. **Telehandler for the movement of the large structures. Wheelbarrows/ pale trucks but move loose dig out.**

The following is attached

- Site map with compound
- Excavating holes method statement
- Tree survey plan
- Tree and plan overlays onto proposed layout

From my understanding that is everything that is need. But let me know if there's anything we've missed.

Warm Regards

Olly
