Executive Summary		
Site Location and Proposed Development	Hedyn, TM Webber & CJG Hill (the Client) is proposing the construction of a new residential development at land to the north of Coverack Road in Newport, NP19 0DH. The proposed development will consist of a five storey building containing 40No. flats, 32 car parking spaces, soft landscaping and bio diverse landscaping for SuDS compliance.	
Site History	The site has previously been occupied by a wharf, several buildings, a paint mill, depot, railway lines, and a tank.	
Geology	Tidal Flat Deposits are recorded above St Maughan's Group. Made ground is anticipated above the natural deposits.	
Radon	No radon protective measures are required for new developments constructed at ground level on the investigation site.	
Anticipated Ground Conditions	Stratum	Base Depth (m)
	Made ground	4.3-5.4
	Tidal Flat Deposits (firm becoming soft grey CLAY)	14.3-14.8
	Firm grey gravelly CLAY	16.1-16.3 (intermittent)
	Sand & gravel with cobbles	20.2-20.9
	St Maughan's Group	>20.2
Potential Contamination of Concern	Metals, metalloids, PAH, petroleum hydrocarbons, VOCs, and SVOCs.	
Anticipated Foundation Solution	Based upon the desk study information, it is likely that a piled foundation will be necessary for the site.	
Recommended Further Works	It is recommended that an intrusive investigation is undertaken to inspect the ground conditions, to take soil samples for laboratory chemical and geotechnical testing; to install groundwater monitoring wells within the underlying shallow aquifer and to install shallow ground gas and vapour monitoring wells.	
	It is perceived a combination of dynamically sampled boreholes and cable percussive boreholes will be suitable to investigate the site.	
	Soils and groundwater should be tested for a broad suite of potential contaminants.	
	It is recommended that 3No dedicated shallow gas wells be installed within made ground with the response zone situated above groundwater level. The purpose of the gas well is to test made ground soils for potential on-site derived ground gas and vapour contamination and as a potential migration route for off-site ground gasses.	
	Installations should be tested for carbon dioxide, methane, oxygen, hydrogen sulphide and carbon monoxide using a suitable gas analyser. Atmospheric pressure and gas flow should also be recorded. In addition, the installations should be monitored for volatile organic compounds (VOC) using photo-ionisation detector with a 10.6eV lamp.

SECTION 1 Introduction & Proposed Development

1.1 Background

Hedyn, TM Webber & CJG Hill (the Client) is proposing the construction of a new residential development at land to the north of Coverack Road in Newport, NP19 0DH. The proposed development will consist of a five storey building containing 40No. flats, 32 car parking spaces, soft landscaping and biodiverse landscaping for SuDS compliance. The proposed layout can be seen in **Figure 1.1**.

Figure 1.1 Proposed Site Layout

Kennedy James Griffiths (KJG) are the Architects for the project.

TFW Group Ltd (Terra Firma) have been commissioned by the Client to undertake a Tier 1 Geotechnical and Geoenvironmental Report

This report comprises a Tier 1 (Desk Study) including a Preliminary Geoenvironmental Risk Assessment and Geotechnical Site Investigation.

1.2 Objectives

Land Contamination Risk Management (LCRM) guidance provided by the Environment Agency advocates using a tiered approach. This comprises Tier 1; the Preliminary Risk Assessment, Tier 2; the Generic Quantitative Risk Assessment and Tier 3; the Detailed

Quantitative Risk Assessment. As each tier is completed a decision is made whether it is necessary to advance to the next tier.

In addition to LCRM, geotechnical aspects of the development also need to be considered and are approached in a similar manner, with the risks identified in the preliminary assessment, and then investigated through subsequent phase of investigation.

1.2.1 Tier 1

The main objectives of the Tier 1 Geoenvironmental Assessment programme are:

- provide information on past and current uses of the site and surrounding area;
- identify the likely potential environmental liabilities at the site associated with any soil, groundwater, vapour and gas contamination from past site and surrounding land uses;
- provide information on the likely ground conditions beneath the site, including soil types, groundwater and if made ground is likely to be present;
- produce an initial conceptual site model, to detail the nature and extent of potential contamination, its source, potential pathways and likely receptors (pollutant linkage);
- prepare a preliminary human health and environmental risk assessment for the site; and
- inform the design of subsequent phases of intrusive site investigation.

The main objectives of the Preliminary Geotechnical Assessment programme are:

- identify possible geotechnical risks pertaining to the development; and
- scrutinise the risk, if any, from legacy coal mining features.

In order to achieve the above objectives, Terra Firma carried out an assessment programme including a site walkover* and a review of existing data.

1.3 Geotechnical Category

In accordance with BS EN 1997-1:2004+A1:2013, the proposed development comprises the following geotechnical category:

Geotechnical Category 2: conventional types of structures and foundation with no exceptional risk of difficult soil or loading conditions (e.g., spread, raft & pile foundations; retaining structures; excavations; earthworks and ground anchors).

1.4 Information Sources

The following sources of information have been referenced in support of this assessment:

- Landmark Envirocheck Report (**Annex A**)
- British Geological Map Sheet (ST38NW 1:10,560 and 1:50,000 Sheet 249)
- Client provided information, plans etc. (**Figure 1.1**)
- Geology of the South Wales Coalfield Part 1 The country around Newport (Mon.) and
- Historical investigations.

1.5 Roles & Responsibilities

Table 1.1 Roles and Responsibilities

Role	Organisation	Contact Details
Client/Developer	Hedyn	Josh Guy - 07704664797

Geotechnical/Geoenvironmental Consultant	Terra Firma Group Ltd	02920 735354
Architect	Kennedy James Griffiths	info@ysprojects.co.uk
Local Authority	Newport City Council	01633 656656

1.6 Limitations & Exceptions of Investigation

The Client has requested that a Tier 1 Geoenvironmental and Geotechnical Risk Assessment (Desk Study) be undertaken to enable the outlined main objectives.

The Tier 1 report was conducted, and this report has been prepared for the sole internal reliance of the Client and their design and construction team. This report shall not be relied upon or transferred to any other parties without the express written authorisation of TFW Group Ltd. If an unauthorised third party comes into possession of this report, they rely on it at their peril and the authors owe them no duty of care and skill. The report represents the findings and opinions of experienced geoenvironmental and geotechnical consultants. TFW Group Ltd does not provide legal advice and the advice of lawyers may be required.

Human health and environmental risk assessment outcomes may not take into account the potential for the creation of new contaminant linkages as a result of variation to the proposed development and recommended engineering solutions. It is therefore imperative that the Client engages a geoenvironmental consultant to re-visit the conceptual site model and potential risks upon completion of final designs, prior to development.

1.7 Quality Assurance

The quality, health, safety and environmental aspects of the assessment comply with Terra Firma business management system which is UKAS accredited and complies with the requirements of BS EN ISO 9001:2015, BS EN ISO 14001:2015 and BS EN ISO 45001:2018 standards.

SECTION 2 Review of Existing Data

2.1 Physical Setting & Current Site Use

The development site is square in shape and locates just off Coverack Road, Newport, NP19 0DS. The site centres on an approximate national grid reference of 332000, 187760, occupying a plan area of approximately 0.17 Hectares.

The site appears to be an old storage yard, located within a housing estate.

The borders of the site are metal palisade security fence fencing.

The offsite features can be defined as roads to the northeastern, southeastern and southwestern borders. To the northwestern boundary is a carpark. Further to the southwestern boundary is the river Usk, and the rest of boundaries are more residential buildings a mix between flats and houses. Also to the north is the George Street Bridge passing overhead.

The site elevation is approximately 8m AOD and is fairly flat apart from the western boundary where the site slope down to meet the River Usk.

The site location can be seen on **Figure 2.1**.

Figure 2.1 Site Location

2.2 Historical Setting

Historical maps of the site have been obtained in an Envirocheck report, provided by Landmark Information Group. The history plans are supplied in **Annex A** of this report, and the most relevant editions are summarised in **Table 2.1**. Distances, where quoted are approximate, and any changes in-between map editions may not be recorded.

Table 2.1 Historical Development from Map Information

Map Edition & Scale	Key Features On Site	Key Features Off Site
1883-1884 1:2,500	The site is occupied by two small buildings. Two small embankments occupy the north and west of the site. The site is situated on the banks of the River Usk. A possible pond lies on the site's southeast boundary and continues off-site to the southeast.	The River Usk lies 55m to the southwest. On the southwest banks of the Usk are 12 dock wharfs with associated railway lines, beyond which is the town of Newport. The embankments that occupy the site continue off-site to the north and east. Field land lies to the north, south, and east. East Usk Railway terminates 230m to the east. Four small buildings are located 100m to the southeast.
1901-1902 1:2,500	There is now a wharf on site with one railway line, along rectangular building along the northwest of the site and two small buildings at the north corner.	A wharf lies directly to the north, with associated railway lines passing the site's northeast boundary. Rows of terrace housing lie 25m to the northeast of the site. On the other side of the Usk the 'Goods Depot' has continued expanding, there are now more Wharfs and railway lines. 'Usk Chemical Works' is 360m to the south and East Usk Oil Works is 330m to the northwest.
1920-1921 1:2,500	There is now a weighing machine on site. The two small building at the north are no longer evident. Two new buildings are located at the east of the site.	'Imperial Mills (Wire)' is located 13m to the south with associated railway lines. A tramway depot and 'Electric Power Station (Newport Corporation)' are located 150m and 250m to the northwest. The housing estates to the north and northwest have carried on expanding.
1937 1:2,500	The wharf remains on site. The long rectangular building has been removed. Two new buildings have been constructed at the west and north corners, and a further three buildings constructed at the east corner.	The surrounding housing estates have carried on expanding with the houses on Coverack Road being built 30m northeast of the site.
1955-1957 1:2,500	The site is recorded as 'Uskside Paint Mills'. Buildings occupy the north, west, and east corners.	An electric substation is located 11m to the northeast. An 'Electricity Board Stores Depot' lies to the immediate northwest. The 'Imperial Mills (Wire)' is now labelled as 'Imperial Wagon Works'. A wheel works lies 16m to the east. Further south of the wagons works is a 'Coal Dump' and associated railway lines.
1965-67 1:1,250	The railway lines on site have been dismantled up to the site entrance. The site remains occupied by a Paint Mill. but the buildings at the northwest, north, and south of the site are no longer	George Street Bridge has been built to the immediate northwest of the site. The 'wheel works' has been removed.

	evident. A tank is located at the south of the site.	
1988 1:1,250	The Paint Mill building and tank still occupy the north and south corners respectively. A depot building has been built at the west of the site.	The 'Imperial Wagon Works' is now labelled as 'Works'. The railway lines associated with it have been dismantled and the 'Coal Dump' and its associated railway lines have been dismantled. The 'Electric Power Station (Newport Corporation)' has been dismantled and the 'Tramway Depot' is now labelled as 'Bus Depot'.
1993 1:1,250	The remaining railway lines have been removed from the site entrance, and the southern portion of the paint mill has been demolished. Otherwise, the site remains unchanged.	The 'Electricity Board Stores Depot' has now been given the label 'Depot'. The 'Imperial Wagon Works' is now labelled as 'Works', its buildings reduced in size, and remaining railway lines dismantled.
2003 1:10,000	No changes have been recorded on the site.	The works to the south has been demolished.
2013 1:10,000	The buildings have been demolished, and the site is unoccupied.	The land previously occupied by the works has been developed by houses and residential apartments.
2025 Aerial Image	The site appears to be used as a storage compound. A large stockpile of soil is located at the southern corner of the site.	The depot to the north of George Street Bridge has been redeveloped into residential apartments. Land beneath the bridge is occupied by a car park.

2.3 Geological Setting

2.3.1 Geological Mapping

The 1:50,000 and 1:10,560 scale British Geological Survey maps of the area, Sheet 249 and Sheet ST38NW respectively, and the online BGS GeoIndex map viewer were consulted for geology underlying the site.

Detailed stratigraphical information beneath the site is provided in **Table 2.2**.

Table 2.2 Detailed Stratigraphical Information

Age	Formation	Description
Devonian	St Maughans Formation	Interbedded purple, brown and green sandstones and red mudstones with intraformational conglomerates containing calcrete clasts. Placed at top of Bishop's Frome ('Psammosteus') Limestone Member of the Raglan Mudstone Formation. At base of Brownstones and (locally) Senni Beds, where sandstone-dominated sequences begin.

Tidal Flat Deposits are recorded above the bedrock. Tidal flat deposits, including mud flat and sand flat deposits, form extensive nearly horizontal marshy land in the intertidal zone that is alternately covered and uncovered by the rise and fall of the tide. They consist of unconsolidated sediment, mainly mud and/or sand. They may form the top surface of a deltaic deposit.

The Tidal Flat Deposits are likely to be underlain by coarse granular deposits, deposited during the Ice Age when sea level was significantly lower than it is today. The Geology of the South Wales Coalfield Part 1 The country around Newport (Mon.) states that a borehole located just

100m or so from the site, sunk in the River Usk for the George Street Bridge, records soft dark blue silt with small gravel and sand (TFD) to a depth of 4.9m AOD above sand and gravel, and sand and gravel with cobbles to 10.4m AOD. St Maughan's Group was recorded beneath the superficial deposits.

Strata are typically dipping 20° to the southwest in the local area.

An extract of the 1:10,560 geological map is presented on **Figure 2.2**.

Figure 2.2 Geological Map Extract (ST38NW)

2.3.2 BGS Borehole Information

A search of the British Geological Survey (BGS) GeoIndex has been undertaken for available borehole records on, or in proximity to the site.

BGS borehole, reference number St38NW73 is present 237m to the north of the site. The geological log has been summarised in **Table 2.3**.

Table 2.3 Summary of BGS Borehole Record (ID*)

Depth Range (m)	Description	
0.0 – 6.4	Made ground	
6.4 - 7.3	Clay	Tidal Flat Deposits
7.3 – 10.4	Sandy clay	
10.4 – 12.5	Very sandy clay	
12.5 - 16.9	Gravel	River Terrace Deposits
>16.9	Red Sandstone	St Maughan's Group

2.3.3 Mining and Mineral Sites

The site sits outside the South Wales Coal Field and will therefore be unaffected by shallow mining or mine gas.

There are no BGS mineral sites recorded within 1km of the site.

2.4 Natural Hazards

2.4.1 Geotechnical Risks

The natural hazards have been considered for their potential geotechnical risk to the proposed development in **Table 2.4**.

Table 2.4 Summary of Geotechnical Risks

Hazard	Hazard Potential	Details
Ground Dissolution / Karstic Features	No Hazard	The geology underlying the site comprises sandstone / mudstone rocks of St Maughans Formation which are not prone to dissolution.
Collapsible Ground	No hazard	The geology underlying the site comprises sandstone / mudstone rocks of St Maughans Formation which are not prone to collapsible ground features.
Compressible Ground	Moderate	Tidal flat deposits are expected at the site, they pose a moderate risk of compressible ground because they typically consist of soft silts, clays, and organic materials that are prone to consolidation under load. These sediments are often water-saturated, leading to high compressibility and low bearing capacity
Landslide	Very Low	No landslips have occurred in the area.
Running Sand	Moderate	Tidal flat deposits pose a moderate risk of running sand conditions because they often contain loose, water-saturated fine sands and silts.
Shrinking and Swelling Clays	Low	Tidal flat deposits pose a very low risk of shrinking and swelling clays because they typically consist of silty and sandy sediments with only minor amounts of expansive clay minerals.

2.4.2 Radon

The Envirocheck report (**Annex A**) details that no radon protective measures are required for new developments constructed at ground level on the investigation site.

Additional consideration will need to be given to the requirement of radon protection within basements or other occupied spaces below ground level.

Further guidance on reducing the concentration of radon in new buildings, extensions, conversions and refurbishment projects, in order to reduce the risk to occupants, is provided in BR:211:2023.

2.4.3 Aggressive Ground Conditions

Made Ground

Based on the available information, made ground is anticipated on the site. This is likely to comprise clinker and demolition waste and may contain elevated levels of sulphates and acids

which can be damaging to buried concrete. Therefore, the presence of aggressive agents is considered plausible.

Natural Ground

Tidal flat deposits are a potential source of aggressive agents, and their presence should be considered.

2.5 Environmental Setting

The following sections have been compiled using the Landmark Information Group Envirocheck datasheet and maps which can be found in **Annex A**.

2.5.1 Hydrogeology

Superficial deposits beneath the site have an aquifer designation of unproductive strata.

The bedrock deposits beneath the site have an aquifer designation of secondary aquifer A.

Deeper groundwater flow within the underlying bedrock will be controlled by the strata dip and any fractures or bedding planes within the rock units.

The hydraulic gradient will be at its steepest during periods of heavy rainfall and aquifer recharge.

The groundwater is unlikely to be in hydrological continuity with the River Usk due to the anticipated homogenous composition, and very low permeability of the tidal flat deposits, which will prevent direct groundwater discharge into the river.

The site does not locate within a groundwater source protection zone.

The nearest groundwater abstraction point is located 614m east, operated by Pirelli Cables.

2.5.2 Hydrology

The nearest surface water feature locates off site 27m to the west and comprises the River Usk.

The topography of the site slopes down towards to the west. Surface water is likely to drain in this direction.

2.5.3 Flooding

The recorded flood risks to the site are summarised in **Table 2.5**.

Table 2.5 Flood Risk Summary

Hazard	Risk
Extreme flooding from rivers and seas	No risk according to Envirocheck. It should be noted that the land within 10m to the north, south, and west is a risk.
Groundwater flooding	No risk.
Surface water flooding 1 in 30-year event	No risk.
Surface water flooding 1 in 100-year event	No risk.
Surface water flooding 1 in 1000-year event	No risk.

2.5.4 Waste

Recorded landfill sites within 250m of the site are summarised in **Table 2.6**.

Table 2.6 Landfill Sites Summary

Landfill Name	Distance / Direction	Operation Dates	Deposited Wastes
Riverbank, Mariners Wharf, Newport, Gwent	128 West	1 st March 1977	Only waste produced on site - Hardcore and Rubble
Gaskell Street	152m East	Not supplied	Industrial and Household Waste

There are no licensed waste management facilities or waste transfer sites within 250m of the site.

There are 2 discharge consents located within 250m of the site, the closest is located 84m northwest of the site and is operated by Dwr Cymru Cyfyngedig which is a sewerage network. The other discharge consent is located 237m north of the site which again, is operated by Dwr Cymru Cyfyngedig and is another sewerage network. Both sites fall under the authority of Natural Resources Wales.

2.5.5 Infilled Land

Potentially infilled land features within 250m of the site are summarised in **Table 2.7**.

Table 2.7 Potentially Infilled Land

Feature	Distance/Direction
Infilled Land (Water) Area / Linear feature possible infilled	20m north, from Morris Street to Coverack Road and up to Llanwern Street.
Infilled Land (Water) Area / Linear feature possible infilled	60m northeast, along the top half of Coverack Road.
Infilled Land (Water) Area / Linear feature possible infilled	119m south, stretching beneath Feering Street and Witham Street.
Infilled Land (Water) Area / Linear feature possible infilled	150m north, underneath row of houses perpendicular with Corporation Road
Infilled Land (Water) Area / Linear feature possible infilled	160m north, running below Wharf Road.

2.5.6 Pollution

One recorded pollution incident has occurred within the site's influencing distance. This incident took place 82 meters south of the site on March 15, 1996, and involved "Rubble/Litter or Solids." It was classified as a "Category 3 - Minor Incident."

2.5.7 Sensitive Land Use

The site is not located within a sensitive land use area.

2.5.8 Estimated Urban Soil Chemistry

The British Geological Survey have published estimated urban soil chemistry concentrations locally to the site for a number of common contaminants, i.e. arsenic, cadmium, chromium, lead and nickel. All of the given determinants have anticipated concentrations that are below the recognised trigger levels for a residential with plant uptake scenario/commercial scenario*.

Arsenic Concentration:	<15 mg/kg
Cadmium Concentration:	<1.8 mg/kg
Chromium Concentration:	60 - 90 mg/kg
Lead Concentration:	<100 mg/kg
Nickel Concentration:	15 - 30 mg/kg

2.5.9 Industrial Land Use

Relevant contemporary trade directory entries recorded in proximity of the site are summarised in **Table 2.8**.

Table 2.8 Relevant Contemporary Trade Summary

Company	Distance/Direction	Classification	Status
Harry S Jenkins Ltd	On site	Builders' Merchants	Inactive
Autogen Electrical Engineers	41 Northwest	Vehicle Repair, Testing and Servicing	Inactive
P R Valeting	53m Northwest	Vehicle Cleaning Services	Inactive
PR Communications	54m Northwest	Vehicle Cleaning Services	Inactive
Leading Edge Joinery	53m Northwest	Joinery Manufacturers	Inactive
Eco-Oven Cleaning	83m North	Cleaning Services - Domestic	Inactive
Helen May Ltd	83m North	Cleaning Services - Domestic	Inactive
South Wales Engineering & Finishing	167m Northeast	Metalworkers Including Blacksmiths	Inactive
Kelvedon Coach Painting Co	215m East	Vehicle Repair, Testing and Servicing	Active
R M G Performance Bikes	222m East	Vehicle Repair, Testing and Servicing	Active
Newport Transport Ltd	228m North	Bus and Coach Stations, Depots and Companies	Active

There are no recorded Control of Major Accident Hazards Sites (COMAH) and Notifications of Installations Handling Hazardous Substances (NIHHS) within 250m of the site.

2.6 Historical Nearby Site Investigation Data

2.6.1 Phase 1 Coverack Road

Terra Firma carried out a site investigation for the Phase 1 development of land off Coverack Road, Newport (Report Job Number 14614, dated June 2018). The site is located to the immediate northwest of the current study site.

Variable made ground was confirmed to be present to a depth of between 4.3m and 5.4m. This is underlain by firm becoming very soft grey clay to 14.3m/14.8m, below which fluvial sand and gravel deposits prevail. Sandstone bedrock was confirmed at a depth of between 20.2m and 20.7m.

Site soils were found to be contaminated by arsenic, lead, copper, several PAH'S, aliphatic petroleum hydrocarbon C10 – C12 and numerous VOCs or SVOCs were present at levels above laboratory detection limits. Minor elevated levels of leachable lead and several PAH'S were identified in soils. Minor exceedances of copper and zinc were recorded in groundwater.

Consequently, it was recommended that landscaped or communal garden areas should be capped with 600mm of clean imported soil upon development, and that gas and hydrocarbon vapor protection be installed in all new buildings.

A piled foundation was recommended for the proposed development.

2.6.2 Kelvedon Street

Terra Firma carried out a site investigation at land off Kelvedon Street, Newport (Report Job Number 16573, dated November 2024). The site is located 195m east of the current study site.

Made ground was recorded to a depth of 1.2m and was underlain by soft bluish grey clay (tidal flat deposits), becoming firm from around 6m. The clay is underlain by reddish brown sandy slightly gravelly clay (probably residual St Maughan's Group) from 10.5m, passing into competent conglomerate and mudstone from 13.5m.

Contamination, including metals, VOCs, SVOCs, MTBE, BTEX, and PAH was recorded across the site.

A piled foundation was again recommended for the proposed development.

2.7 Unexploded Ordnance Risk (UXO)

Based on the historical setting of the site and Zetica UXO Risk Maps, little or no military activity has been recorded within the area. Therefore, it is considered that the risk from Unexploded Ordnance is low.

2.8 Ecology

The site is covered by hardstanding, and minimal vegetation has been identified.

Please note that Terra Firma are not specialists in this field and the advice of an ecology expert may need to be sought before undertaking any site works.

2.9 Site Services

Buried utility services and their backfill can provide preferential pathways for gas, vapour or groundwater to migrate to other parts of the site or to a sensitive receptor. They can also represent significant constraints to development.

A statutory utility search and review has been undertaken.

Fortunately, due to the nature of the site, being unused for so many years there aren't any services present on site.

SECTION 3 Preliminary Human Health & Environmental Risk Assessment

3.1 General

The Tier 1 preliminary human health and environmental risk assessment is a qualitative evaluation of unacceptable risks to human health or the environment from potential 'contaminated land', based on reviewed information in preceding sections of this report.

For contaminated land to exist as defined in Part 2A of the Environmental Protection Act 1990, a contaminant linkage needs to be identified. Contaminant linkages are defined by having a valid 'source – pathway – receptor' as established in the preliminary conceptual site model.

For our definitions of contaminant linkages and how we define risk please refer to **Annex B** which includes our classifications of consequence and probability, and risk assessment matrix.

3.2 Potential Sources of Contamination

Potential or known sources of contamination associated with the site current and historical land uses are summarised in **Table 3.1**.

Table 3.1 Contamination Sources

ID	Contamination Source	Contaminant	Source Information of
S1	Demolition waste	Heavy Metals, Asbestos and Fibrous Materials, PAHs	Historical maps
S2	Past on site and surrounding industries (paint mill, depot, railway lines, unknown tank)	Petroleum Hydrocarbons, Volatile and Semi Volatile Organic Compounds (VOCs and SVOCs), Metals, metalloids, PAHs	Historical maps and Envirocheck Datasheets
S3	Made Ground	Petroleum Hydrocarbons, Volatile and Semi Volatile Organic Compounds (VOCs and SVOCs), Metals, metalloids, PAHs, Carbon dioxide, methane, depleted oxygen, hydrogen sulphide, carbon monoxide	Historical maps and Envirocheck Datasheets
S4	Landfills	Carbon dioxide, methane, depleted oxygen, hydrogen sulphide, carbon monoxide	Envirocheck Datasheets

3.3 Potential Pollution Pathways

Potential contaminant pathways associated with a **residential without home grown produce land use** are summarised in **Table 3.2**.

Table 3.2 Contamination Pathways

ID	Pathway
P1	Direct soil and dust ingestion
P2	Plant uptake & consumption of home grown produce
P3	Dermal contact
P4	Inhalation of dust and vapours
P5	Vertical migration of leachates/liquid contaminants (unsaturated zone)

P6	Horizontal and vertical migration of contaminants (saturated zone)
P7	Artificial contaminant pathway (borehole, pile, excavation etc)
P8	Surface run-off
P9	Horizontal and vertical migration of ground gasses and vapours
P10	Direct contact with construction materials
P11	Inhalation of asbestos fibres

3.4 Potential Receptors

There are human and hydrological receptors to any contamination that may be present on site. Potential receptors are summarised in **Table 3.3**.

Table 3.3 Contamination Receptor

ID	Receptor
R1	Construction and maintenance workers
R2	Future site users (residents)
R3	Passers-by or neighbouring site users
R4	Groundwater (aquifer)
R5	Surface waters (river)
R6	Area of public open space
R7	Construction materials (concrete/potable water pipes)
R8	Areas of Sensitive Land (SSSI's etc)

3.5 Preliminary Conceptual Site Model

The preliminary conceptual site model establishes potential contaminant linkages between contaminants (source), pathways and receptors, realised during the preparation of the Tier 1 assessment. Where a potential contaminant linkage is identified, an assessment of risk is subsequently undertaken. The preliminary conceptual site model is tabulated in **Table 3.4**.

Outcomes of the preliminary conceptual site model are then used as a basis for the design and implementation of the site investigation, whereby point sources of potential contamination can be targeted, as well as investigating more broadly the wider site.

Findings of the site investigation can in turn be used to develop and refine the conceptual site model.

3.5.1 Data Gaps & Uncertainties

Key data gaps and uncertainties identified in the conceptual site model at Tier 1 assessment stage include:

- there are no previous site investigations available for the site, therefore no information is available on actual concentrations of contaminants in soil and groundwater at this stage;
- the precise ground conditions below the site are unknown; and
- groundwater depth and flow direction are conceptual at this stage.

Table 3.4 Preliminary Conceptual Site Model

Source	Pathway	Receptor	Preliminary Risk Assessment		
			Consequence	Probability	Risk & Justification
Human Health					
S1, S2, S3	Direct soil and dust ingestion P1 Dermal contact P3 Inhalation of dust and vapours P4 Inhalation of asbestos fibres P11	Construction and maintenance workers R1	Medium	Low Likelihood	Low Risk: COSHH assessment and good level of PPE/ hygiene by site workers/ staff; dust suppression measures to be adopted, if required.
		Passers-by or neighbouring site users R3	Medium	Unlikely	Near Zero Risk: Dust suppression measures may be adopted to mitigate this risk, if required.
		Future site users R2	Severe	High Likelihood	High Risk: The site is to be occupied by a vulnerable end-user, and the site has been previously occupied by potentially contaminative end uses. The Phase 1 development to the north has recorded several contaminants. A source-pathway-receptor linkage is highly possible.
Landfill Gas S4	Horizontal and vertical migration of ground gasses and vapours P9	Future site users R2, Construction and maintenance workers R1	Severe	Unlikely	Low Risk: The nearest landfill is located 128m from the site and is separated from the site from River Usk. A pathway for landfill gas to migrate is highly unlikely due to them being impermeable and saturated. The site was also only used to landfill hardcore and rubble waste produced on site. The landfill 152m to the east is located beneath terrace houses that were built by 1922. Either this landfill is positioned incorrectly, has been removed during the construction of the houses or the age of the landfill means landfill gas is unlikely to still be produced. The impermeable and saturated soils will also act as a barrier to gas migration
Ground Gas S3			Severe	Low Likelihood	Medium Risk: The site is likely to be underlain by a significant thickness of made ground, although it's unlikely to comprise a significant concentration of biodegradable material
Vapours S2, S3			Severe	Likely	High Risk: Previous land uses on site could be a source of hydrocarbons and VOCs/SVOCs

Impacted Groundwaters S1, S2, S3	Horizontal and vertical migration of contaminants (saturated zone) P6 Dermal contact P3	Construction workers R1 and maintenance	Medium	Unlikely	Near Zero Risk: Construction workers are unlikely to encounter groundwater unless during piling. Groundwater should be dealt with appropriately to prevent dermal contact.
Soils S1	Direct Contact P10	Construction materials (water pipes) R7	Mild	Low Likelihood	Low Risk: An appropriate water supply pipe material should be chosen after the potable water supplier has completed an assessment in accordance with UK Water Industry Research guidance; Guidance for the Selection of Water Supply Pipes to be used in Brownfield Sites, UKWIR Report Ref: 10/WM/03/21.
Aggressive ground conditions – Sulphates S1		Construction materials (concrete) R7	Mild	Low Likelihood	Low Risk: Chemical analysis of the soils must be undertaken and the appropriate classification of concrete should be specified as per BRE Special Digest 1: Concrete in Aggressive Ground.
Aquatic Environment					
Soils (leachate) S1, S3	Surface run-off P8	Surface waters (river/lake) R5	Medium	Likely	Medium Risk: Leachate from made ground soils of unknown origin and composition, likely to contain elevated metals and PAHs. Site is located adjacent to river.
Soil (leachate) S1, S3 Free Product S2	Vertical migration of leachates/liquid contaminants (unsaturated zone) P5	Groundwater (aquifer) R4	Medium	Low Likelihood	Low Risk: Leachate unlikely to migrate through the cohesive alluvium soils between the made ground and gravels at depth. Free product is not anticipated but not discounted due to the previous site uses. Piles are likely to be used for foundations. Precautions should be taken to ensure they do not act as preferential pathway between shallow soils and aquifer at depth.
Soil (leachate) S1, S3 Free Product S2	Horizontal and vertical migration of contaminants (saturated zone) P6	Surface waters (river/lake) R5	Medium	Likely	Medium Risk: Leachate from made ground soils of unknown origin and composition, likely to contain elevated metals and PAHs. Site is located adjacent to river. Free product is not anticipated but not discounted due to the previous site uses. If it is present, it could migrate to the nearby river.
		Groundwater (aquifer) R4	Medium	Low Likelihood	Low Risk: Groundwater located in gravel is unlikely to be affected by contamination at shallow depth. Free product from site is unlikely to migrate through the impermeable clays to the gravels at depth. Piles are likely

					to be used for foundations. Precautions should be taken to ensure they do not act as preferential pathway between shallow soils and aquifer at depth.
--	--	--	--	--	---

3.6 Conclusion

It is determined that potential contaminant linkages have been identified, and more information is needed to refine the conceptual site model. It is therefore necessary to proceed to a Tier 2 generic quantitative risk assessment.

SECTION 4 Preliminary Engineering Recommendations

Recommendations given in this section are based upon the available desk study information and need to be confirmed by a relevant intrusive investigation.

4.1 Preliminary Ground Model

Based on the available desk study information anticipated ground conditions at the site are summarised in **Table 4.1**.

Table 4.1 Anticipated Ground Conditions

Stratum	Base Depth (m)
Made ground	4.3-5.4
Tidal Flat Deposits (firm becoming soft grey CLAY)	14.3-14.8
Firm grey gravelly CLAY	16.1-16.3 (intermittent)
Sand & gravel with cobbles	20.2-20.9
St Maughan's Group	>20.2

4.1.1 Groundwater

Groundwater is anticipated at a depth of approximately 14.5m.

4.2 Preparation of Site

Areas of hardstanding should be broken up and removed from beneath the proposed development site.

Allowances should be made for any temporary/permanent support works to any existing adjacent structure necessary as a result of the proposed works.

Contingencies should be made for the protection/diversion of any underground/overhead services present beneath/above the site brought about as a result of the proposed works.

Any reduced levels should be brought up to the required levels with suitable inert mainly granular materials. Department of Transport (DTP) type 2 sub-base or similar should be used and compacted in layers to the requirements of the Specification for Highway Works.

Allowances should also be made for the excavation of any soft spots/areas and their replacement with well compacted imported granular materials.

In accordance with EC Regulation 1272/2008 and Environment Agency Guidance WM3 soils and other materials destined for off-site disposal should be classified on the basis of their hazard phrases prior to disposal. Soils are classified as a mirror entry waste and should be classified on the basis of their specific chemical properties.

4.3 Tentative Foundation and Floor Slab Solution

Based upon the desk study information, it is likely that a piled foundation will be necessary for the site.

4.4 Excavations and Formations

Shallow excavations will likely be possible with normal soil excavating machinery. Hydraulic breaker attachments will be required to break through the surface hardstanding.

Excavations may/are unlikely to encounter shallow groundwater flows. Any inflows together with rainwater infiltration should be dealt with by conventional pumping techniques.

4.5 Storm Water Drainage

Soakaway drainage is unlikely to be viable due to the depth and likely contaminated nature of the made ground.

The suitability of stormwater drainage should however be confirmed by in-situ soakaway testing.

Proposed soakaways should be positioned at least 5.0m away from any structure.

SECTION 5 Recommended Site Investigation

5.1 General

An intrusive site investigation designed and justified in accordance with guidance provided in BS10175:2011+A2:2017 must be undertaken to achieve the following objectives:

- Identify the potential environmental liabilities at the site associated with any soil, gas, vapours and groundwater contamination from past site uses, to substantiate and enhance the conceptual site model, for a residential without home grown produce scenario.
- Provide a summary of the environmental conditions at the site, together with any necessary remediation works to render the site fit for its intended use.
- Provide recommendations regarding any relevant geotechnical aspects pertaining to the development

5.2 Intrusive Investigation

It is recommended that an intrusive investigation is undertaken to inspect the ground conditions, to take soil samples for laboratory chemical and geotechnical testing; to install groundwater monitoring wells within the underlying shallow aquifer and to install shallow ground gas and vapour monitoring wells.

It is perceived a combination of dynamically sampled boreholes and cable percussive boreholes will be suitable to investigate the site.

Soakaway testing may also be required to aid drainage design.

5.3 Soil Sampling Strategy

Soil sampling locations must be selected on a targeted basis to investigate suspected/known sources of contamination or potential contamination migration pathways. This includes sampling of the stockpile located at the south of the site.

Soil sampling locations must also be selected on a non-targeted basis to characterise the contamination status of the site. A triangular/herringbone sampling pattern should be adopted.

5.4 Recommended Soil Chemical Analysis

It is recommended that soil samples be taken of the made ground and underlying natural materials and tested at an accredited laboratory for the determinands listed in **Table 5.1**.

Table 5.1 Soil Laboratory Analysis

Metals & Metalloids	In-Organics	Organics	Others
Arsenic	Cyanide	Phenols	pH (acidity)
Cadmium	Sulphate	PAH	Asbestos
Chromium III		Petroleum Hydrocarbons	
Chromium VI		VOCs	
Copper		SVOCs	
Lead			
Mercury			
Nickel			
Selenium			
Zinc			

Soil samples exhibiting elevated levels of metal and metalloid determinands should be further schedule for leachate testing of the offending substance.

5.5 Recommended Groundwater Chemical Analysis

It is recommended that a proportionate groundwater sampling exercise be undertaken in accordance with BS ISO 5667-11:2009. Samples should be suitably extracted from the superficial aquifer and tested at accredited laboratory for a suite of potential contaminants, listed in **Table 5.2**.

Groundwater contamination if present is anticipated to be diffuse as there is no clearly defined source. Groundwater sampling should therefore be undertaken on a non-targeted basis, but it is recommended that at least 3No triangulated groundwater wells be installed for this purpose.

Additional groundwater samples may be required if concerns are raised during the initial round of testing or the aquifer is significant in depth and a risk of contaminant stratification is considered likely.

Table 5.2 Groundwater Laboratory Analysis

Metals & Metalloids	In-Organics	Organics	Others
Arsenic	Cyanide	Phenols	pH (acidity)
Cadmium	Sulphate	PAH	Hardness
Chromium III	Sulphide	Petroleum Hydrocarbons	Oxygen Demands
Chromium VI		VOCs	Electrical Conductivity
Copper		SVOCs	
Lead			
Mercury			
Nickel			
Selenium			
Zinc			

5.6 Recommended Ground Gas and Vapour Assessment

It is recommended that 3No dedicated shallow gas wells be installed within made ground with the response zone situated above groundwater level. The purpose of the gas well is to test made ground soils for potential on-site derived ground gas and vapour contamination and as a potential migration route for off-site ground gasses.

Depending on the depth to groundwater 3No additional wells should be installed wholly within the unsaturated superficial deposits to similarly test the potential migration route for off-site ground gasses and vapours.

Installations should be tested for carbon dioxide, methane, oxygen, hydrogen sulphide and carbon monoxide using a suitable gas analyser. Atmospheric pressure and gas flow should also be recorded. In addition, the installations should be monitored for volatile organic compounds (VOC) using photo-ionisation detector with a 10.6eV lamp.

With reference to CIRIA C665:2007 Tables 5.5a and 5.5b, it is considered that a gas monitoring programme comprising 6 visits over a 3 month period sufficient, however, this may need to be extended to a larger programme of 9 visits over 6 months if any concerns are raised during the initial monitoring period. At least two sets of readings should be at low and falling atmospheric pressure.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Geotechnical & Geoenvironmental Specialists

Monmouthshire

Published 1886 - 1887

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Newport

Published 1983

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

VectorMap Local

Published 2024

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Geotechnical & Geoenvironmental Specialists

Monmouthshire

Published 1883 - 1884

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to complement the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Geotechnical & Geoenvironmental Specialists

Monmouthshire

Published 1883 - 1884

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Map Name(s) and Date(s)

028_16 1883 1:2,500	029_13 1883 1:2,500

Map Colour	Lex Code	Rock Name	Rock Type	Min and Max Age
	TFD	Tidal Flat Deposits	Clay and Silt	Not Supplied - Holocene
	ALV	Alluvium	Clay, Silt, Sand and Gravel	Not Supplied - Holocene
	RTDU	River Terrace Deposits (Undifferentiated)	Sand and Gravel	Not Supplied - Quaternary

Bedrock and Faults

Map Colour	Lex Code	Rock Name	Rock Type	Min and Max Age
	PNG	Penarth Group	Mudstone	Not Supplied - Rhaetian
	STM	St Mary's Well Bay Member	Limestone and Mudstone, Interbedded	Not Supplied - Rhaetian
	BLI	Blue Lias Formation	Limestone and Mudstone, Interbedded	Not Supplied - Rhaetian
	BAN	Blue Anchor Formation	Mudstone and Siltstone	Not Supplied - Norian
	MMG	Mercia Mudstone Group	Mudstone	Not Supplied - Early Triassic
	SMG	St Maughans Formation	Argillaceous Rocks and [Subequal/Subordinate] Sandstone, Interbedded	Not Supplied - Early Devonian
	SMG	St Maughans Formation	Sandstone	Not Supplied - Early Devonian
	RG	Raglan Mudstone Formation	Mudstone and Sandstone, Interbedded	Not Supplied - Pridoli
	BFLS	Bishop's Frome Limestone Member	Silicate-Conglomerate, Calcite-Cemented (Calcrete)	Not Supplied - Silurian
		Faults		

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Geology 1:50,000 Maps Coverage

Map ID:	1
Map Sheet No:	249
Map Name:	Newport
Map Date:	1969
Bedrock Geology:	Available
Superficial Geology:	Available
Artificial Geology:	Available
Faults:	Not Supplied
Landslip:	Available
Rock Segments:	Not Supplied

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

ANNEX B
Risk Assessment Definitions

Risk Assessment Definitions

The contaminated land regime is set out in Part 2A of the Environmental Protection Act (EPA) 1990 and was introduced on the 1st April 2000 in England and 1st July 2001 in Wales. A similar regime was introduced in Scotland on 14th July 2000.

Part 2A was introduced to achieve three overarching objectives:

- (a) To identify and remove unacceptable risks to human health and the environment.
- (b) To seek to ensure that contaminated land is made suitable for its current use.
- (c) To ensure that the burdens faced by individuals, companies and society as a whole are proportionate, manageable and compatible with the principles of sustainable development.

Under Part 2A the statutory definition of 'contaminated land' is:

"any land which appears to the local authority in whose area it is situated, to be in such a condition, by reason of substances in, on, or under the land, that:

- (a) Significant harm is being caused or there is a significant possibility of such harm being caused; or
- (b) Pollution of controlled waters is being, or is likely to be, caused."

Under Part 2A, for land to be classified as 'Contaminated Land' there must be one or more contaminant, pathway, receptor linkages, known as the '**Contaminant Linkage**'. A contaminant linkage requires three essential elements:

- (a) A **CONTAMINANT** (SOURCE) – a substance that is in, on or under the land and has the potential to cause harm or to cause pollution of controlled waters.
- (b) A **RECEPTOR** – something which could be adversely affected by a contaminant.
- (c) A **PATHWAY** – a route by which a receptor is or might be exposed to or affected by a contaminant.

Guidance provided by the Environment Agency to aid in managing risks from land contamination (Land Contamination Risk Management - LCRM), defines a 'Hazard' as:

'Hazard – a property or situation that in particular circumstances could lead to harm'

The term 'Risk' is widely used in different contexts and situations, but a prescriptive definition is also given in LCRM guidance:

'Risk – a combination of the probability, or frequency of occurrence of a defined hazard and the magnitude of the consequences of the occurrence'.

A framework for qualitative risk assessment is provided in CIRIA publication C552 Contaminated Land Risk Assessment – A Guide to Good Practice (2001). The method requires an assessment of the magnitude of the probability of the risk occurring and the magnitude of the potential consequence. Classifications of consequences and probability, levels and descriptions of risk have been devised from the above publication and are defined in the following sections.

Classification of Consequence

Table A Classification of Consequence	
Classification	Definition
Severe	• Short term (acute) risk to human health likely to result in significant harm. • Short term risk to controlled waters. • Catastrophic damage to buildings/structures. • Short term risk to an ecosystem or organism within the particular ecosystem.
Medium	• Chronic damage to human health (long term risk). • Pollution of a sensitive water resource. • A significant change in an ecosystem or organism within the ecosystem.
Mild	• Pollution of non-sensitive water resources. • Significant damage to buildings/structures. • Damage to sensitive buildings/structure/services or the environment.
Negligible	• Harm (not necessarily significant) which may result in financial loss. • Non-permanent health effects to humans (easily prevented by PPE for example). • Easily repairable effects of structural (building) damage.

Classification of Probability

Table B Classification of Probability	
Classification	Definition
High Likelihood	• There is a complete contaminant linkage and an event appears very likely to occur in the short term and is inevitable in the long term. • Evidence of harm to the receptor.
Likely	• There is a complete contaminant linkage which means that it is probable that an event will occur. • The event is not inevitable but possible in short term and likely in the long term.
Low Likelihood	• There is a complete contaminant linkage and circumstances are possible under which an event could occur. • It is not certain that an event will occur in the long term, and it is less likely to occur in the short term.
Unlikely	• There is a complete contaminant linkage but circumstances are such that it is improbable that an event would occur even in the long term.

Risk Assessment Matrix

By comparing the consequences of a risk and the probability of the risk of a contaminant linkage, the likely risk category can be determined as shown in **Table C** below.

Table C Risk Assessment Matrix					
Increasing acceptability ↘		Consequence			
		Severe	Medium	Mild	Negligible
Probability	High Likelihood	High risk	High risk	Medium risk	Low risk
	Likely	High risk	Medium risk	Low risk	Near zero risk
	Low Likelihood	Medium risk	Low risk	Low risk	Near zero risk
	Unlikely	Low risk	Near zero risk	Near zero risk	Near zero risk

Description of Risks and Likely Actions

High Risk

There is a high probability that severe harm could arise to a receptor, or there is evidence that a receptor is currently being severely harmed. The risk if realised is likely to result in liability, and urgent investigation or remediation will be required.

Medium Risk

It is probable that harm will arise to a receptor. However, it is relatively unlikely that such harm would be severe, or if harm does occur the harm is likely to be relatively mild. Investigation will be required to determine the liability, and some remedial works may be required in the long term.

Low Risk

It is possible that harm may arise to a receptor, but it is likely that the harm would be mild.

Near Zero Risk

There is a very low risk of harm to the receptor. In the event of harm being realised the harm is not likely to be severe.
