1.0 Introduction

Geo² Remediation Limited were commissioned by Fuel Serv Ltd, Fuel 24 Ltd and Rotner & Rudge Ltd to conduct a Phase I Preliminary Risk Assessment and Phase II Intrusive Investigation of a parcel of land located at

Newport Garage,

71 Cardiff Road,
Newport,
NP20 2EN.

The site is approximately 0.15 hectares in area and located at grid reference 330890, 187050.

The study was undertaken prior to proposed purchase of the site for redevelopment for a continued commercial use.

1.1 Scope of Works

The assessment has been undertaken in accordance with the Environment Agency Guidance, Land Contamination Risk Management, consisting of a desk-study and preliminary risk assessment followed by an intrusive sub-surface ground investigation and generic quantitative risk assessment, conducted in order to establish the presence and extent of sub-surface contaminants, if any, resulting from the site's current and historic land use.

The intrusive investigation was conducted on 28th February 2024. The investigation was undertaken in accordance with Geo²'s Method Statement SMS SI 1492. The findings of the investigation are presented herein.

2.0 Description of the Site and Surroundings

2.1 Site Description

The site is located 1.15km south-west of the city of Newport. Figures 1 and 2 in Appendix A show the location of the site.

The site is currently a derelict Petrol Filling Station (PFS) predominantly comprising hardstanding with overgrown vegetation present across the site. The PFS covers the majority of the site. The PFS shop is derelict, and the canopy is still present. The site is understood to have been derelict since at least 2008.

The area shown within the red site boundary on Figure A below, will be referred to throughout this document as 'the site'.

The site is located south of Cardiff Road (B4237) and west of Mendalgief Rd and is currently accessed by one ingress/egress point located at the northern Site boundary.

Figure A: Site Location Plan. Red is approximate site boundary and pink are 50m and 100m buffers.
Extract from Envirocheck report (Appendix C).

2.2 Site Walkover

A site walkover was undertaken on 28th February 2024, with a photographic survey included in Appendix B. The site walkover findings are detailed below.

The site was observed to be largely flat.

The site is predominantly occupied by a derelict PFS with former shop building and carwash. The shop building is in the western portion of the site, with the carwash in the south and the forecourt in the centre.

The site is covered in concrete and tarmac, observed to be in a fair to poor condition.

No aboveground storage tanks (ASTs) were identified on site, with a number of underground storage tanks (USTs) in the east of the site.

No evidence of spills or leaks were observed within the site area. No other visual or olfactory evidence of contamination was observed during the site walkover of the site.

2.3 Site Surroundings

The site is located in the western area of the town of Newport, south Wales. The nearest residential properties are situated directly east and to the south. The surrounding land uses of the site are summarised in Table 1 below.

Direction	Land Use
North	Cardiff Rd (B4237) with Belle Vue Park and Royal Gwent Hospital beyond
East	Mendalgief Rd with residential dwellings beyond
South	Woodland (former railway lines) with new residential properties beyond
West	Vacant land associated with the former garage

Table 1. Land Uses in the Surrounding Area.

2.4 Site Infrastructure

2.4.1 Surfacing and Drainage.

A single interceptor is located in the south east of the site.

The site is covered in concrete and tarmac, observed to be in a fair to poor condition.

All pump islands had been removed from the forecourt area.

A service plan showing the location of services is provided as Figure 3 in Appendix A.

2.4.2 Fuel Storage Infrastructure

The tank farm, containing three identified Underground Storage Tanks (USTs), is located in the east of the site, with the tank lids filled with concrete, potentially indicating decommissioning of these. Vent pipes are located to the south of the carwash.

Known tank details are summarised in Table 2, below.

Tank No.	Capacity (L)	Type	Location	Status
1	-	UST	Tank Farm, east of the forecourt	Unknown
2	-			Unknown
3	-			Unknown

Table 2. Summary of Known Tank Capacity and Contents.

No further details were made available to Geo² at the time of the investigation.

3.0 Desk Study

3.1 Desk Study Data

Information regarding the environmental setting of the site was obtained from the Geo² Phase 1 report, which collated information from a variety of sources. A copy of the Envirocheck report is presented in Appendix C.

Where indicated in Tables 3 and 4 below, the data from the Envirocheck report has been supplemented with additional information obtained from freely available online data.

Site Geology	BGS data indicates bedrock consists of St Maughans Formation comprising argillaceous rocks and sandstone. Superficial deposits are mapped in the north-eastern corner only and are indicated to comprise Tidal Flat Deposits (clay and silt). No available BGS borehole logs are present within 100m, the closest available data is approximately 525 m to the north-west of the Site (Ref: ST38NW111) and comprises several entries up to a maximum depth of 5.0 m bgl. The ground conditions generally comprised the following sequence: • Topsoil up to a maximum depth of 0.50 m bgl; • Made Ground comprising Tarmac, Brick, Concrete up to a maximum depth of 2.2 m bgl; • Stiff reddish brown silty CLAY up to a maximum depth of 3.0 m bgl; • Underlain by weathered bedrock of silty MUDSTONE up to an unproven depth of 5.0 m bgl. There is one BGS Recorded Mineral Site located approximately 653 m south-west of the Site, which likely relates to the brickfields discussed in Section 4.0. The site has no to very low hazard regarding the potential for ground stability hazards including collapsible ground, compressible ground, ground dissolution, landslide, running sand and shrinking and swelling clays. However, the south-east of the Site had a moderate hazard potential for running sand.
Coal	The site is not within an area which may be affected by coal mining activity, therefore the risk to the proposed development from shallow coal mining is considered to be Low.
Radon	The site is in a low probability radon area (less than 1% of homes are estimated to be at or above the Action Level). As such, no radon protective measures are necessary in the construction of new dwellings or extensions.

Table 3. Environmental Assessment of the Site.

Site Hydrogeology	The bedrock is classified as a Secondary A Aquifer – defined as permeable layers that can support local water supplies, and may form an important source of base flow to rivers. The superficial deposits are classified as an Unproductive Aquifer – largely unable to provide usable water supplies and are unlikely to have surface water and wetland ecosystems dependent on them. The site is not located within a Source Protection Zone (SPZ). The nearest groundwater abstraction point is located approximately 940m south of the Site, operated by Corus UK Ltd and British Steel Plc with a use for general metal. The groundwater beneath the site in the combined productive bedrock and no superficial aquifer has been classed as High vulnerability with intermediate pollutant speed.
Site Hydrology	The nearest surface water feature is located 118m west and is the water course and waterfalls in Belle Vue Park, flowing south. The River Usk (Afon Wysg) is located >1km east of the Site, flowing southwards to the Bristol Channel. There are no pollution incidents or discharge consents within 250m of the site.
Waste and Infilled Land	There are six entries relating to historical landfill sites within 1,000 m of the Site recorded within the Envirocheck Report. Two entries located within 500 m of the Site, approximately 336 and 462 m to the south, were operated by Network Rail and British Rail and relate to inert waste. Four surrendered licensed waste management facilities are located within 1,000 m of the Site, the closest of which was located approximately 402 m to the north-east relating to St Woolos Hospital and operated by Aneurin Bevan Health Board. The license was in operation from 1994 until 2002 and was categorised as a clinical waste transfer station. Three instances of potentially infilled land (non-water) relating to unknown filled ground of a pit or quarry are located 600-1000 m to the south-east of the Site. Given the distance from the Site, this is likely to be associated with the BGS Recorded Mineral Site as discussed in Section 3.1. There are several records of infilled land (water) recorded within 500 m of the Site, dated 1922. This is focused in areas to the south of the Site and is likely associated with the expansion of industrial activities, as discussed in Section 4.0.
Unexploded Ordnance	A review of Zetica online risk mapping for the area indicates the site is located in a Low risk area with respect to unexploded ordnance.

Table 4. Environmental Assessment of the Site, continued.

4.0 Site History

4.1 Review of Historical Mapping

Details regarding the development of the site, its immediate surroundings and potentially contaminative land uses were obtained from a review of historical maps.

Copies of the maps are provided in Appendix C and a brief summary is provided in Table 5 with a more detailed summary provided in Table 6 below and Table 7 on the following page.

Key Historical Activities	
On-Site	The Site comprised railway tracks until 1950s when it was developed as a Garage, which extended off Site to the west. The Site was further developed in the 1970s as a Petrol Filling Station which later ceased operations (circa 2009).
Off-Site	Adjacent to the Site boundary to the east, south and west the Site comprised railway tracks with Cardiff Road adjacent to the northern Site boundary until 1980s. The wider Site area to the south predominantly comprised industrial development including a Steel Works and associated railway lines, chimneys and tanks circa 1937.

Table 5. Brief Summary of Historical Land Use On-Site and Off-Site.

All distances given in Table 6 and Table 7 on the following pages are approximate and are relative to the site, unless otherwise stated.

Date	On-Site	Off-Site	Potential Contamination
1883 – 1887	The Site predominantly comprises railway tracks transversing from the north-east to the south-west, labelled as part of Great Western Railway. A small structure is present centrally in the southern portion of the Site. A small vegetated area is present in the north-east corner of the Site.	Adjacent to the northern Site boundary is Cardiff Road, with agricultural fields beyond. A further series of railway lines bound the north-east, south-east and southern portion of the Site. A tank is present approximately 5 m to the east of the Site. A Foundry (Iron and Bass) is labelled approximately 310 m south-east of the Site. A further two foundries are labelled between 690 and 800 m south-east. Four brickfields are labelled between approximately 450 and 910 m south-east of the Site.	Potential Made Ground, Railway embankments and sidings, Iron Works and associated infrastructure, off-Site Tank.
1901	No significant changes.	Foundries and brickfields are no longer present and have been replaced with residential terraced housing. Newport and Monmouthsire Hospital present approximately 215 m north-east of the Site. Bellevue Park present approximately 95 m north-west of the Site.	No significant changes.
1920-1921	No significant changes.	Expansion of the Alexandra Railway approximately 350 m south-west of the Site. Hospital renamed Royal Gwent Hospital.	Potential for Made Ground and contamination associated with railway and embankments.
1937	A structure is present in the south of the Site. The Railway tracks transversing across Site are no longer present.	Expansion of railway tracks adjacent to the southern Site boundary. Courtybella Steel Works with associated structures, tanks, and chimney labelled approximately 140 m south-west of the Site. Additional buildings associated with the Royal Gwent Hospital present approximately 120 m north-east of the Site.	Steel Works and associated infrastructure including several tanks, chimneys. Made ground associated with the removal of railways tracks on Site. Made ground associated with the development of the Steel Works.

Table 6. Detailed Summary Review of Historical Mapping (1883-1937)

Date	On-Site	Off-Site	Potential Contamination
1954-1957	A large structure which extends off Site to the west is present and labelled Bell Vue Service Garage.	Additional buildings associated with the Courtybella Steel Works now present approximately 80 m and 325 m south of the Site. Several tanks, likely associated with Courtybella Steel Works present approximately 370 m south of the Site.	Made ground associated with the redevelopment of the Site into the Bell Vue Service Garage. Steel Works and associated infrastructure including several tanks, chimneys. Made ground associated with the development of the Steel Works.
1962-1974	Structure extending off-Site to the west relabelled as Garage.	Steel works to the south of the Site labelled Works. Railway lines to the south-west labelled as Sidings and a pond is present approximately 500m. Additional buildings associated with the Royal Gwent Hospital are present approximately 70 m north of the Site.	No significant changes.
1977-1983	Two smaller structures are present on Site along the western Site boundary.	No significant changes.	Development of the Site and associated structures, likely to be associated with an active Petrol Filling Station.
1987	No significant changes.	The majority of the railway lines to the south-west of the Site have been removed and the pond is no longer present.	Potential for back-filled pond to be a source of ground gases.
2000	Much of the eastern portion of the Site comprises dense vegetation comprising trees and shrubs.	No significant changes.	No significant changes.
2001	Aerial mapping indicates that the western portion of the Site is used as a Petrol Filling Station comprising predominantly hard standing.	No significant changes.	No significant changes.
2009	Aerial mapping show the Site area fenced off and appears to be disused.	Buildings associated with the former Steel Works to the south of the Site appear to have been demolished.	No significant changes.
2010-2022	Overgrown vegetation present in the west of the Site.	Area to the south of the Site, associated with the former Steel Works is undergoing redevelopment into residential housing.	No significant changes.
2023	No significant changes.	Aerial mapping shows the demolition of the buildings associated with the garage mapped to the west of the Site.	No significant changes.

Table 7. Detailed Summary Review of Historical Mapping (1954 – Present Day)

4.2 Additional Details

No other offsite sources of potentially significant contamination have been identified.

5.0 Preliminary Risk Assessment

5.1 Source – Pathway – Receptor

UK legislation and guidance on assessing potentially contaminated land recommends the use of a risk assessment process based on a review of source/pathway/receptor relationships for various environmental media. The first stage of any risk assessment is to identify, using the desk study data and site information, the presence and extent of any hazard at the site, theoretical or demonstrable.

A key component of the overall risk assessment process is identification of “significant contaminant linkages” between contaminants and receptors. This can be accomplished through development of a site-specific conceptual model in which the potential contaminants, pathways and receptors identified on-site are described.

Each element can be defined as follows:

- **Contaminant source:** A substance either on or under the land and which has the potential to cause harm or pollution to human or environmental receptors.
- **Pathway:** A route or means by which a receptor can be exposed to or affected by a source.
- **Receptor:** A living organism or an ecological system, or controlled water, or property including buildings, crops and livestock.

The presence of all three of the above elements identifies a contaminant linkage and a potentially unacceptable risk. To ensure that any risk present to, or, from the site can be appropriately managed each of these contamination linkages will be targeted by the investigation.

5.2 Hazard Identification

Potentially contaminative on-site activities relate to the historical use of the site as a filling station from the 1970s to circa 2009, and the historical use of the Site for railway lines. Contamination sources that are likely to exist relate to the presence of Made Ground, and the potential presence of underground storage tanks (USTs).

Due to the age of the buildings on site, it is likely that asbestos containing materials were used in the construction of the building, and there may be the potential for asbestos to be present in shallow Made Ground soils.

Potentially contaminative off-Site activities relate to the historical industrial uses of the surrounding area including foundries, brickfields, steel works and railway lines.

5.3 Initial Conceptual Site Model

All contamination linkages arising as a result of the interconnection of the contaminant source, contamination pathways and potential receptors are summarised in Table 8 on the following page. These contamination linkages are used to design the site investigation, guiding the type of investigation, location of exploratory boreholes and the required sample analysis.

Linkage No.	Source	Pathway	Receptor
1	Potential contamination (e.g. hydrocarbons (TPHs)) associated with historical operation of the site as a PFS and the potential presence of UST's. Potential for asbestos to be present within the underlying Made Ground. Potential contamination (Made Ground) associated with the historical use of the Site for railway lines including heavy metals and PAHs.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer	Nearest surface water feature located in Belle Vue Park 118m northwest, flowing south
2			Bedrock Secondary A Aquifer Superficial deposits mapped as absent across the majority of the site, with an Unproductive Aquifer in the eastern corner. No SPZ or potable groundwater abstractions
3		Exposure to harmful vapours, hazardous ground gas and tainting of water supply	Current and proposed Commercial site end users
4			Neighbouring site users, principally within enclosed spaces
5		Direct contact, ingestion	Proposed Commercial site end users in areas of soft landscaping or in buildings
6	Off-Site historical industrial uses of the surrounding area	Leaching to groundwater, lateral and vertical flow to site	
7	Ground gas from unknown thickness of made ground on and around the site	Vertical and lateral migration of hazardous ground gasses	

Table 8. Identified Initial Contamination Linkages

6.0 Site Investigation

In order to provide an assessment of each of the identified contamination linkages, an intrusive investigation was specified to obtain further information regarding the geology of the site and the quality of the soils and groundwater.

6.1 Site Investigation

Seven soil bores (SB1-SB7) were constructed on 28th of February 2024 to depths of up to 4.0m below ground level (m bgl) at locations indicated on Figure 3 presented in Appendix A. The soil bores were constructed using window sampling techniques. As a result of the drilling techniques, relatively undisturbed soils were able to be obtained for field and laboratory analysis and for logging of ground conditions. Field analysis comprised the examination of each of the samples for visual and olfactory indications of contamination. Analysis was also conducted for volatile hydrocarbons using a photo-ionisation detector (PID).

The site investigation was limited by a combination of the small size of the site and the existence of buried services. Borehole positions were chosen strategically so to target areas of the site most likely to be contaminated. Table 9 below, shows the location rationale of boreholes.

Target / Rational for Investigative Locations	Location						
	SB1	SB2	SB3	SB4	SB5	SB6	SB7
General Site Coverage	✓		✓				
Tank Farm					✓	✓	
Interceptor/Drainage				✓	✓		
Forecourt	✓	✓	✓	✓		✓	✓

Table 9. Borehole Location Rationale

6.2 Ground Conditions

The logs of the boreholes, which are presented in Appendix D, detail the ground conditions and the sampling depths together with the visual and olfactory characteristics of the soils.

Ground conditions encountered across the site comprised concrete or tarmac hardstanding over made ground. Hardstanding was typically 0.1-0.3m thick.

Made ground comprised a layer of brown/grey gravelly, sandy crush (subbase) with gravels of brick, sandstone, limestone and concrete. The depth of made ground ranged between 0.9-1.7m bgl.

Natural superficial soils were described as firm to stiff clay, becoming cobbly with depth.

Mudstone bedrock was encountered across the site, with the base of this not proven.

6.2.1 Obstructions

Two locations, SB2 and SB5 refused on man-made obstructions, both considered likely to be cobbles or brick within the made ground.

6.2.2 Observed Potential Contamination

Slight hydrocarbon (HC) odours were noted within made ground in SB1 (1.4m bgl), northeast of the forecourt.

These odours corresponded to slightly elevated PID readings in this window sample at this depth, with a maximum concentration of 5.1ppm.

6.3 Groundwater Investigation

No monitoring wells were installed during the investigation, as no evidence of significant contamination, granular made ground or groundwater was identified.

However, seven historic wells, EX1 – EX7 were identified, with most wells having perched water present, likely to have been contained within the made ground. Installation details for these wells is not known. Wells were monitored for groundwater depth, and water samples were obtained for laboratory analysis following completion of the ground investigation on 28th February 2024.

Groundwater data is presented in Table 10, below.

Monitoring Well	Location on Site	Response Zone (m bgl)	Target Strata	Depth to Product (m bgl)	Depth to Water (m bgl)	Depth to Base (m bgl)
EX1	Northeast of forecourt	-	-	-	1.850	1.950
EX2	East of forecourt	-	-	-	2.075	3.830
EX3	Northwest of forecourt	-	-	-	1.802	3.640
EX4	Southwest of forecourt	-	-	-	2.920	4.905
EX5	South of forecourt	-	-	-	1.648	4.270
EX6	South of USTs	-	-	-	1.869	2.895
EX7	South of USTs	-	-	-	-	1.740

Table 10. Groundwater Monitoring Data

7.0 Laboratory Analysis

7.1 Analysis Rationale

Eight soil and five water samples were selected for laboratory analysis following field screening, via visual and olfactory methods.

Samples were analysed for contaminants associated with historical and current use of the site as a PFS and garage in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practise (CIRIA C552, 2001).

All samples were placed in laboratory provided containers and stored in cool boxes prior to being transported to the laboratory under the laboratory's chain of custody documentation. The laboratory used for the ground investigation on this occasion was Envirolab, a UKAS and MCERTS accredited laboratory.

7.2 Soils Analysis

Analysis scheduled for soil samples is shown below in Table 11. The soil samples were selected from a range of depths and strata and from across the site, to gain an understanding of site-wide ground conditions.

Exploratory Hole	Sample Depth (m bgl)	Target Strata	Suite of Analysis
SB1	3.8	Mudstone	TPH-CWG, BTEX, MTBE, TOC
SB2	0.4	Made Ground	CLEA Metals, Asbestos ID
SB3	1.3	Clay	TPH-CWG, BTEX, MTBE
SB4	0.3	Made Ground	CLEA Metals, Asbestos ID
SB4	1.3	Sand	TPH-CWG, BTEX, MTBE
SB5	0.3	Made Ground	TPH-CWG, BTEX, MTBE, CLEA Metals, Asbestos ID
SB6	1.8	Clay	TPH-CWG, BTEX, MTBE, VOC, SVOC, TOC
SB7	2.8	Mudstone	TPH-CWG, BTEX, VOC, SVOC

Table 11. Soil Sample Selection Strategy

The analysis, conducted by a Gas Chromatography / Flame Ionisation Detector (GC/FID) and Gas Chromatography / Mass Spectrometry (GC / MS) comprised fractionation and speciation of hydrocarbons including analysis for benzene, toluene, ethylbenzene and xylenes (BTEX) and MTBE compounds. Selected samples were analysed for:

- Heavy metals by IRIS emission spectroscopy.
- Volatile and semi volatile components (including PAHs and PCBs), by GC/MS.
- Asbestos Containing Materials (ACMs) by Polarised light microscopy / Gravimetry.

The analytical results were analysed for contaminants associated with use of the site as a PFS and generic industrial land use. The results of soil analysis were compared using the following UK guidance:

- LQM/CIEH's Suitable for Use Levels (S4ULs)
- DEFRA Category 4 Screening Levels (C4SLs);
- EIC Soil Generic Assessment Criteria for Human Health (2010).

7.2.1 Soil Testing Results

The results of laboratory analyses on the soil samples undertaken are presented in Appendix E.

Due to the site's current and proposed continued end use as a PFS, the soil analysis testing results have been compared against 'Commercial' end use Generic Assessment Criteria (GACs) thresholds. GAC concentrations associated with a conservative 1% Soil Organic Matter (SOM) have been utilised.

No contaminants were recorded above the 'Commercial' GACs in any of the soil samples analysed.

Asbestos identification testing was undertaken on 3no made ground soil samples, with asbestos present in the sample from SB2 (0.4m), quantified as loose fibres of Chrysotile at a % of 0.001.

7.3 Groundwater Analysis

Analysis scheduled for groundwater samples is shown below in Table 12.

Exploratory Hole	Sample Depth (m bgl)	Suite of Analysis	Site Observations
EX2	2.50 – 3.50	TPH-CWG, BTEX and MTBE.	Slight HC odour
EX3	2.00 – 3.00	TPH-CWG, BTEX and MTBE.	No visual or olfactory evidence of HC contamination
EX4	3.50 – 4.50	TPH-CWG, BTEX and MTBE.	No visual or olfactory evidence of HC contamination
EX5	2.50 – 3.50	TPH-CWG, BTEX and MTBE.	No visual or olfactory evidence of HC contamination
EX6	2.00 – 2.70	TPH-CWG, BTEX and MTBE.	No visual or olfactory evidence of HC contamination

Table 12. Groundwater Sample Selection Strategy

The analysis, conducted by a Gas Chromatography / Flame Ionisation Detector (GC/FID) and Gas Chromatography / Mass Spectrometry (GC / MS) comprised fractionation and speciation of hydrocarbons including analysis for hydrocarbons, benzene, toluene, ethylbenzene and xylenes (BTEX) compounds and MTBE.

The samples were analysed for contaminants associated with use of the site as a PFS and former garage. The results of analyses of the water samples were compared to screening criteria sourced from the following legislation:

- Water Supply (Water Quality) Regulation, 2018.
- Standards for Hazardous Substances (from the WFD, 2006/60/EC), 2013.
- Drinking Water Quality Standards England and Wales (DWS), amended 2016.

- Environmental Quality Standards (EQS) as presented in the River Basin Districts Typology, Standards and Groundwater Threshold Values (England and Wales) Directions, 2022.
- World Health Organisation (WHO), Guidelines for Drinking Water Quality, 2017.
- SoBRA Generic Assessment Criteria for Assessing Vapour Risks to Human Health from Volatile Contaminants in Groundwater, 2017.

7.3.1 Groundwater Testing Results

The results of laboratory analyses on the groundwater samples undertaken, detailed in Table 12, are presented in Appendix E.

Although slightly elevated hydrocarbon contamination was present in the sample from EX2, all concentrations were below guidance, including SoBRA GAC and WHO guidelines, indicating no risk to site end users from volatile contaminants in groundwater on site.

8.0 Risk Estimation

8.1 Discussion of Investigation Findings

Historic use of the site as a garage and PFS was identified in the Preliminary Risk Assessment as the main potential source of site contamination, along with nearby potentially contaminative land uses.

Environmental chemical analysis on 8no soil samples for a range of contaminants, did not identify any contaminants above GAC. Asbestos was recorded within 1no of the made ground samples analysed, although this was quantified as being at 0.001%.

Groundwater monitoring and sampling recorded no hydrocarbon fractions marginally above GAC.

Encountered ground conditions across the site identified 0.9-1.7m thickness of made ground across the site, comprising a gravelly, sandy crush fill. Superficial deposits are described as firm to stiff clay with occasional gravels and cobbles. No gross contamination was identified during site works.

No evidence of an offsite source impacting upon the site, or offsite migration of any contaminants was identified, although gas migration cannot be ruled out.

8.2 Limitations and Uncertainty

It is important to note that the investigation was restricted in areas of the site due to buildings and buried services, this was especially true around the forecourt, USTs and drainage.

8.3 Qualitative Risk Assessment

Each of the identified potential contamination linkages in the preliminary conceptual site model is reviewed based upon the findings of the site investigation which allows a greater understanding of the ground conditions at the site, site observations, soil and groundwater quality and chemical analysis.

The qualitative risk assessment is undertaken, detailed in Table 13 on the following page, in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practice CIRIA C552, 2001. The purpose of this assessment is to determine the relative significance of the identified contamination linkages by assessing the probability of an impact occurring and by assessing the perceived severity of an impact to a receptor.

The perceived risk is based on a consideration of both the likelihood of an event (probability) occurring, and the severity of the potential consequence. Classification of these two factors is detailed in Appendix F.

Those linkages considered of low risk or less on the basis of the available site data will not be considered any further in this assessment. Linkages considered to be more significant are identified as presenting potentially unacceptable risk to the identified receptor. In these instances, further works may be considered necessary.

Source	Pathway	Receptor	Probability	Severity	Risk Classification
Investigation recorded no exceedance of GAC in any of the groundwater samples analysed.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer	Nearest surface water feature located in Belle Vue Park 118m northwest, flowing south	Low Likelihood Taking into account the low permeable superficial deposits and distance to the nearest surface water receptor	Mild (non sensitive receptor)	Low
		Bedrock Secondary A Aquifer Superficial deposits mapped as absent across the majority of the site, with an Unproductive Aquifer in the eastern corner. No SPZ or potable groundwater abstractions	Low Likelihood Taking into account lack of contamination in perched groundwater, distance to nearest groundwater abstraction point along with low permeability superficial deposits.	Mild (non sensitive receptor)	Low
Investigation recorded no hydrocarbon contamination above GACs, although some odours were noted.	Exposure to harmful vapours, hazardous ground gas and tainting of water supply	Current and proposed Commercial site end users	Unlikely Taking into account the presence of USTs, but no significant exceedances of SoBRA threshold levels, coupled with low permeability superficial deposits.	Medium (Human Health)	Low
		Neighbouring site users, principally within enclosed spaces	Unlikely Taking into account that the nearest residential properties are adjacent to the site, however no significant contamination identified.	Medium (Human Health)	Low

Table 13a. Summary of Qualitative Risk Assessment

Source	Pathway	Receptor	Probability	Severity	Risk Classification
No asbestos register has been obtained; the pre-2000 development of the site makes asbestos presence in building fabrics possible. Asbestos in one location, but no other contaminants above GAC noted.	Direct contact, inhalation and ingestion	Current and proposed Commercial site end users, principally within landscaped area	Unlikely No Soil GAC exceedances, and although asbestos recorded in one location, current and proposed hardcover use of the site severs the exposure pathway.	Medium (Human Health)	Low
			Unlikely No significant contamination identified during investigation.	Medium (Human Health)	Low
Off-Site historical industrial uses of the surrounding area	Leaching to groundwater, lateral and vertical flow to site	Proposed Commercial site end users	Unlikely No soil GAC exceedances and no evidence of significant contamination identified.	Medium (human health)	Low
Ground gas from unknown thickness of made ground on and around the site	Vertical and lateral migration of hazardous ground gasses	Proposed Commercial site end users	Unlikely No recorded gross contamination, putrescible material or significant thickness of made ground present	Medium (human health)	Low

Table 13b. Summary of Qualitative Risk Assessment

9.0 Conclusions and Recommendations

9.1 Conclusions

A Phase I Preliminary Risk Assessment and Phase II Intrusive Investigation of the site, located on Newport Garage, 71 Cardiff Road, Newport, NP20 2EN was undertaken, prior to proposed purchase of the site, for a continued commercial use.

The purpose of the assessment was to evaluate the potential for risk to be posed to human health and sensitive environmental receptors from historical and current use of the site.

During the site walkover undertaken on 28th February 2024, no visual or olfactory evidence of contamination was identified at the site, with the site a derelict PFS with three known USTs.

The historical activities as a petrol filling station, with known USTs, may have resulted in the site containing a variable thickness of made ground that may include harmful materials (e.g., ACMs). No identified leaks from the tanks have been made known to Geo² at the time of writing this report.

No significant contamination was identified within soils during the investigation. Asbestos was present at low levels in one location, however the current and proposed hardcover use of the site severs any potential pathway by which receptors could likely be impacted.

The underlying superficial deposits (clay) and mudstone bedrock, with a Secondary A Aquifer within the bedrock indicate a potential risk to groundwater receptors. However, as no significant contamination was noted during the investigation, potential risks are reduced.

As such, Geo² considers there is a **Low** risk to human health receptors and a **Low** risk to the groundwater receptor.

9.2 Recommendations

The following measures are recommended to address the identified risks:

- Should future development works take place on site, the potential presence of unidentified contaminated material should be considered, as costs for offsite disposal of these materials may be significant.
- During any redevelopment the presence of asbestos in shallow soils should be considered both with regards to health and safety during redevelopment works, but also disposal costs of any excavated material.

10.0 Limitations

Geo²'s conclusions, recommendations and opinions are based on information gathered at the time of the investigation from a variety of third-party sources and from observations made during site reconnaissance. Therefore, there may be conditions at the site that have not been taken into account which were not apparent at the time of investigation.

A portion of this report is based solely upon information provided by third parties. The information has not been independently verified by Geo². Whilst this report and the opinions given in it are accurate to the best knowledge of Geo², Geo² cannot guarantee the completeness or accuracy of any descriptions, opinions or conclusions based solely upon information that has not been independently verified.

The recommendations contained within this report represent our professional opinions. These opinions were arrived at in accordance with currently accepted industry practices and hydrological and engineering practices at this time. As such they are not a guarantee that the site is free of hazardous materials or conditions.

Geo² prepared this report for our Client; any third parties using this report do so entirely at their risk. Geo² makes no warranty or representation whatsoever, express or implied, with respect to the use by a third party of any information contained in this report or its suitability for any purpose. Geo² assumes no responsibility for any costs, claims, damages or expenses (including any consequential damages) resulting from the use of this report or any information contained in this report by a third party.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Geology 1:50,000 Maps Coverage

Map ID: 1
Map Sheet No: 249
Map Name: Newport
Map Date: 1969
Bedrock Geology: Available
Superficial Geology: Available
Artificial Geology: Available
Faults: Not Supplied
Landslip: Available

LANDMARK INFORMATION GROUP®

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Envirocheck®

LANDMARK INFORMATION GROUP®

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

LANDMARK INFORMATION GROUP®

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to complement the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Published 1902

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

LANDMARK INFORMATION GROUP[®]

Monmouthshire

Published 1922

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Newport

Published 1983

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2023

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

The diagram illustrates a vertical borehole log with various soil strata identified by patterns and descriptions:

- CONCRETE**: Indicated at the top surface.
- MADE GROUND - Grey, dry, sandy GRAVEL fill of concrete, flint and sandstone.**: Layer between 0.20m and 0.40m depth.
- MADE GROUND - Brown, firm, plastic, slightly gravelly REWORKED CLAY. Gravels of sandstone, brick and clinker.**: Layer between 0.40m and 0.90m depth.
- CLAY - Soft to firm, plastic, reddy brown CLAY.**: Layer starting at 0.90m depth.
- MUDSTONE - Red/brown, dry, weathered MUDSTONE. Becoming competent with depth.**: Layer starting at 1.80m depth.

Vertical scale markers are provided on both sides of the log, ranging from 0.20m to 10.0m.

End of Borehole at 3.80m

Report Notes

General

This report shall not be reproduced, except in full, without written approval from Envirolab.
 The results reported herein relate only to the material supplied to the laboratory.
 The residue of any samples contained within this report, and any received within the same delivery, will be disposed of **four weeks** after the initial scheduling. For samples tested for Asbestos we will retain a portion of the dried sample for a minimum of **six months** after the initial Asbestos testing is completed.
 Analytical results reflect the quality of the sample at the time of analysis only.
 Opinions and Interpretations expressed are outside our scope of accreditation.
 The client Sample No, Client Sample ID, Depth to top, Depth to Bottom and Date Sampled are all provided by the client.
 A deviating sample report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

Key

Superscript "#"	Accredited to ISO 17025
Superscript "M"	Accredited to MCertS
Superscript "U"	Individual result not accredited
None of the above symbols	Analysis unaccredited
Subscript "A"	Analysis performed on as-received Sample
Subscript "D"	Analysis performed on the dried sample, crushed to pass 2mm sieve.
Subscript "A"	Analysis has dependant options against results. Details appear in the comments of your Sample receipt
IS	Insufficient Sample for analysis
US	Unsuitable Sample for analysis
NDP	No Determination Possible
NAD	No Asbestos Detected
N/A	Not applicable

Asbestos

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.
 Stones etc. are not removed from the sample prior to analysis
 Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing, and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

Assigned Matrix Codes

1	SAND	6	CLAY/LOAM	A	Contains Stones
2	LOAM	7	OTHER	B	Contains Construction Rubble
3	CLAY	8	Asbestos Bulk (Only Asbestos ID accredited)	C	Contains visible hydrocarbons
4	LOAM/SAND	9	Incinerator Ash (some Metals accredited)	D	Contains glass / metal
5	SAND/CLAY			E	Contains roots / twigs

Note: 7,8,9 matrices are not covered by our ISO 17025 or MCertS accreditation, unless stated above.

Soil Chemical Analysis:

All results are reported as dry weight (<40°C).
 For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.
 For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts
 All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

TPH by method A-T-007:

For waters, free and visible oils are excluded from the sample used for analysis, so the reported result represents the dissolved phase only.
 Results "with Clean up" indicates samples cleaned up with Silica during extraction.

EPH CWG (method A-T-055) from TPH CWG:

EPH CWG results have humics mathematically subtracted through instrument calculation.
 Where these humic substances have been identified in any IDs from "TPH CWG with clean up" please note that the concentration is **NOT** included in the quantified results but present in the ID for information.

Electrical Conductivity of water by method A-T-037:

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the accreditation range and as such are unaccredited.

Please contact your client manager if you require any further information.

Envirolab Deviating Samples Report

Hattersley Science & Technology Park, Stockport Road, Hattersley, SK14 3QU
Tel. 0161 368 4921 email. ask@envlab.co.uk

Client: Geo2 Remediation Ltd, Coniston House,, Louisa Street, Bradford, BD10 8NE

Project No: 24/02177

Project: Newport (NP)

Date Received: 04/03/2024 (am)

Clients Project No: 1492

Cool Box Temperatures (°C): 6.9

NO DEVIATIONS IDENTIFIED

If, at any point before reaching the laboratory, the temperature of the samples has breached those set in published standards, e.g. BS-EN 5667-3, ISO 18400-102:2017, then the concentration of any affected analytes may differ from that at the time of sampling.

Report Notes

General

This report shall not be reproduced, except in full, without written approval from Envirolab.

The results reported herein relate only to the material supplied to the laboratory.

The residue of any samples contained within this report, and any received within the same delivery, will be disposed of **four weeks** after the initial scheduling. For samples tested for Asbestos we will retain a portion of the dried sample for a minimum of **six months** after the initial Asbestos testing is completed.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and Interpretations expressed are outside our scope of accreditation.

The client Sample No, Client Sample ID, Depth to top, Depth to Bottom and Date Sampled are all provided by the client.

A deviating sample report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

Key

Superscript "#"	Accredited to ISO 17025
Superscript "M"	Accredited to MCertS
Superscript "U"	Individual result not accredited
None of the above symbols	Analysis unaccredited
Subscript "A"	Analysis performed on as-received Sample
Subscript "D"	Analysis performed on the dried sample, crushed to pass 2mm sieve.
Subscript "A"	Analysis has dependant options against results. Details appear in the comments of your Sample receipt
IS	Insufficient Sample for analysis
US	Unsuitable Sample for analysis
NDP	No Determination Possible
NAD	No Asbestos Detected
N/A	Not applicable

Asbestos

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing, and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

Assigned Matrix Codes

1	SAND	6	CLAY/LOAM	A	Contains Stones
2	LOAM	7	OTHER	B	Contains Construction Rubble
3	CLAY	8	Asbestos Bulk (Only Asbestos ID accredited)	C	Contains visible hydrocarbons
4	LOAM/SAND	9	Incinerator Ash (some Metals accredited)	D	Contains glass / metal
5	SAND/CLAY			E	Contains roots / twigs

Note: 7,8,9 matrices are not covered by our ISO 17025 or MCertS accreditation, unless stated above.

Soil Chemical Analysis:

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

TPH by method A-T-007:

For waters, free and visible oils are excluded from the sample used for analysis, so the reported result represents the dissolved phase only.

Results "with Clean up" indicates samples cleaned up with Silica during extraction.

EPH CWG (method A-T-055) from TPH CWG:

EPH CWG results have humics mathematically subtracted through instrument calculation.

Where these humic substances have been identified in any IDs from "TPH CWG with clean up" please note that the concentration is **NOT** included in the quantified results but present in the ID for information.

Electrical Conductivity of water by method A-T-037:

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the accreditation range and as such are unaccredited.

Please contact your client manager if you require any further information.

End of Report

Appendix F – Risk Assessment Terminology

Definitions and Classifications of Risk Assessment Terminology.

Probability

Probability can be defined as the chance of a particular event occurring in a given period of time.

Descriptions of each of the four qualitative terms to be used in this report to describe the perceived probability of any identified pollutant linkage becoming realised are shown below in Table W.

Term	Description
High Likelihood	There is pollutant linkage and an event would appear very likely in the short-term and almost inevitable over the long-term, or there is evidence at the receptor of harm or pollution.
Likely	There is pollutant linkage and all the elements are present and in the right place which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short-term and likely over the long-term.
Low Likelihood	There is pollutant linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a long period such an event would take place, and is less likely in the shorter term.
Unlikely	There is pollutant linkage but circumstances are such that it is improbable that an event would occur even in the very long-term.

Table W. Description of Probability Classifications

Severity

Severity (consequence) can be defined as the adverse effects (or harm) arising from a defined hazard, which impairs the quality of human health or the environment in the short or longer term.

Descriptions of each of the four qualitative terms to be used in this report to describe the perceived potential severity of any identified pollutant linkage becoming realised are shown below in Table X.

Term	Description
Severe	Highly elevated concentrations likely to result in "significant harm" to human health as defined by the EPA 1990, Part 2A, if exposure occurs. Equivalent to EA Category 1 pollution incident including persistent and/or extensive effects on water quality; leading to closure of a potable abstraction point; major impact on amenity value or major damage to agriculture or commerce. Major damage to aquatic or other ecosystems, which is likely to result in a substantial adverse change in its functioning or harm to a species of special interest that endangers the long-term maintenance of the population. Catastrophic damage to crops, buildings or property.
Medium	Elevated concentrations which could result in "significant harm" to human health as defined by the EPA 1990, Part 2A if exposure occurs. Equivalent to EA Category 2 pollution incident including significant effect on water quality; notification required to abstractors; reduction in amenity value or significant damage to agriculture or commerce. Significant damage to aquatic or other ecosystems, which may result in a substantial adverse change in its functioning or harm to a species of special interest that may endanger the long-term maintenance of the population. Significant damage to crops, buildings or property.
Mild	Exposure to human health unlikely to lead to "significant harm". Equivalent to EA Category 3 pollution incident including minimal or short-lived effect on water quality; marginal effect on amenity value, agriculture or commerce. Minor or short-lived damage to aquatic or other ecosystems, which is unlikely to result in a substantial adverse change in its functioning or harm to a species of special interest that would endanger the long-term maintenance of the population. Minor damage to crops, buildings or property.
Minor	No measurable effect on humans. Equivalent to insubstantial pollution incident with no observed effect on water quality or ecosystems. Repairable effects of damage to buildings, structures and services.

Table X. Description of Severity Classifications

Once the severity and probability of a pollutant linkage has been determined the risk can be assessed using the risk matrix shown overleaf on Table Y.

Risk Matrix

By cross referencing the derived severity and probability in Table Y, below the perceived potential risk can be determined.

		Severity			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate / Low Risk
	Likely	High Risk	Moderate Risk	Moderate / Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate / Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate / Low Risk	Low Risk	Very Low Risk	Very Low Risk

Table Y. Risk Assessment Matrix

The risk categories detailed above are defined below in the following Table Z.

Term	Description
Very High Risk	There is a high probability that significant harm could arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
High Risk	Significant harm is likely to arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
Moderate Risk	It is possible that without appropriate remedial action, harm could arise to a designated receptor but it is relatively unlikely that any such harm would be severe and if any harm were to occur, it is likely that such harm would be relatively mild.
Low Risk	It is possible that significant harm could arise to a designated receptor from an identified hazard but it is likely that at worst this harm if realised would normally be mild.
Very Low Risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.
