

The Eveswell Community Centre building is looking tired and is dilapidated in many areas. ToCh is therefore looking to refresh the building in order to give something positive and uplifting to the community whilst targeting aggressive and sincere environmentally friendly principles. With this aim in mind a strategy has been developed to give the centre a significant aesthetic make-over which not only looks inviting but also wraps the entire structure in insulation, significantly reducing the energy required to keep it comfortable in winter and summer. Additionally this insulation allows the centre to incorporate renewable technologies such as an air source heat pump and solar PV array which together will provide the energy needed to keep the spaces inside comfortable.
