

The existing barn walls are built from a mix of local, random rubble stone in various natural tones, including browns, greys and purples. The stones vary in size and shape and are laid in an informal pattern with varying joint sizes. Some brick detailing is also present around openings.

Where any areas of stonework need rebuilding or repair, the existing stone will be carefully taken down and re-used. If any new stone is needed, it will be sourced locally to match the original in appearance. All repairs will match the existing in terms of stone size, colour, texture and coursing.

Existing pointing to be carefully scraped out and replaced with new. Pointing will be done using a traditional lime mortar (NHL 2) mixed with locally sourced sharp sand, to allow the building to breathe and avoid trapping moisture. Joints will be repointed with a brushed flush or slightly recessed finish, matching the original style. Any old cement pointing will be carefully removed by hand to avoid damaging the stone.
